Abbreviations and Definitions

SDG	Sample Delivery Group.
MDL	Method Detection Limit.
RDL	Reported Detection Limit.
ND,U	Not detected at the Reporting Limit (or MDL where applicable).
RPD	Relative Percent Difference.
(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Rec.	Recovery.
SDL	Sample Detection Limit.
MQL	Method Quantitation Limit.
Unadj. MQL	Unadjusted Method Quantitation Limit.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our "one location" design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be **YOUR LAB OF CHOICE.**

Our Locations

ESC Lab Sciences has sixty-four client support centers that provide sample pickup and/or the delivery of sampling supplies. If you would like assistance from one of our support offices, please contact our main office. **ESC Lab Sciences performs all testing at our central laboratory.**

Terracon Project No. AL127481-4C

Dear Ms. Lyons:

The purpose of this report is to present the results of an asbestos and hazardous materials survey performed on October 23, 2015, at the above-referenced building in Salt Lake City, Utah. This survey was conducted in accordance with our Proposal Number PAL150302, dated June 18, 2015.

Friable and Non-friable asbestos-containing materials were detected during the assessment of the building. Please refer to the attached report for details.

Terracon appreciates the opportunity to provide this service to Salt Lake City Corporation and The Redevelopment Agency of Salt Lake City. If you have any questions regarding this report, or if you need assistance with project oversight and sampling during demolition of this building, please contact Michael Dunbar at (801) 545-9062.

Sincerely,

Terracon Consultants, Inc.

1.0 INTRODUCTION

Terracon conducted an asbestos and hazardous materials survey of the Schovaers Electronics building located at 22 Jeremy Street, Salt Lake City, Utah. The survey was conducted on October 23, 2015, by AHERA-accredited and State of Utah-certified asbestos inspectors in accordance with Terracon Proposal No. PAL150302, dated June 18, 2015. Interior and exterior building components were surveyed and homogeneous areas of suspect asbestos-containing materials (ACM) were visually identified and documented. Although reasonable effort was made to survey accessible suspect materials, additional suspect but un-sampled materials could be located in walls, in voids, or in other concealed areas. Suspect ACM samples were collected in accordance with the sampling protocols outlined in Environmental Protection Agency (EPA) regulation 40 CFR 763 Asbestos Hazard Emergency Response Act (AHERA), and the State of Utah, Division of Air Quality (DAQ), Utah Administrative Code R307-801 – Asbestos Rule. Samples were delivered to an accredited laboratory for analysis by Polarized Light Microscopy (PLM).

1.1 Project Objective

The asbestos and universal wastes survey was requested to support planning for future redevelopment in the area. EPA regulation 40 CFR 61, Subpart M, National Emission Standards for Hazardous Air Pollutants (NESHAP), prohibits the release of asbestos fibers to the atmosphere during renovation or demolition activities. The asbestos NESHAP and the State of Utah DAQ require that potentially regulated asbestos-containing materials be identified, classified and quantified prior to planned disturbances or demolition activities.

2.0 BUILDING DESCRIPTION

The building consists of a front office area and a production area. General construction is a slab-on-grade with exterior block walls, wood-framed interior gypsum walls, and a metal-decked asphalt and gravel roof. Interior finishes consist of vinyl floor tiles and mastic, vinyl sheet flooring and mastic, finished and unfinished gypsum wallboard, ceiling tile, and carpets. The east exterior elevation has a stucco finish.

3.0 FIELD ACTIVITIES

The survey was conducted by Mr. John Larson and Mr. Michael Dunbar, AHERA-accredited and State of Utah-certified asbestos inspectors. The inspectors were also registered Pre-demolition Building Inspectors. Universal hazardous wastes were inspected in accordance with the Salt Lake County Health Department's (SLCHD) Solid Waste Management and Permitting Regulation #1. Copies of Mr. Larson's and Mr. Dunbar's asbestos inspector training certificates, State of Utah Inspector Certificates, and the SLCHD Pre-demolition Building Inspector Registrations are provided in Appendix 5. The survey was conducted in accordance with the sample collection protocols established in EPA regulation 40 CFR 763, AHERA. A summary of survey activities is provided below.

3.1 Visual Assessment

Our survey activities began with a visual observation of the structure's interior and exterior to identify homogeneous areas of suspect ACM. A homogeneous area consists of building materials that appear similar throughout in terms of color, texture, and date of application. Interior and exterior assessment was conducted throughout visually accessible areas of the building including the roof.

Building materials identified as concrete, glass, wood, masonry, metal, or rubber were not considered suspect ACM and were not sampled during this survey.

3.2 Physical Assessment

A physical assessment of each homogeneous area of suspect ACM was conducted to assess the friability and condition of the materials. A friable material is defined by the EPA as a material that can be crumbled, pulverized, or reduced to powder by hand pressure when dry. Friability was assessed by physically touching suspect materials.

3.3 Sample Collection

Based on the results of the visual observation, bulk samples of suspect ACM were collected in general accordance with AHERA sampling protocols. Random samples of suspect materials were collected in each homogeneous area. The inspector collected bulk samples using wet methods as applicable to reduce the potential for fiber release. Samples were placed in sealable containers and labeled with unique sample numbers using an indelible marker.

Terracon collected 48 bulk samples from 16 homogeneous areas of suspect ACM. A summary of suspect ACM samples collected during the survey is included as Appendix 1.

3.4 Sample Analysis

Bulk samples were submitted under chain-of-custody to International Asbestos Testing Laboratories of Mt. Laurel, New Jersey, for analysis by polarized light microscopy with dispersion

staining techniques per USEPA method 600/R-93/116. The percentage of asbestos, where applicable, was determined by microscopic visual estimation. International Asbestos Testing Laboratories is accredited under the National Voluntary Laboratory Accreditation Program (NVLAP) Accreditation No. 101165-0.

4.0 REGULATORY OVERVIEW

The asbestos NESHAP (40 CFR Part 61, Subpart M) regulates asbestos fiber emissions and asbestos waste disposal practices. It also requires the identification and classification of existing building materials prior to demolition or renovation activity. Under NESHAP, asbestos-containing building materials are classified as either friable, Category I non-friable or Category II non-friable ACM. Friable materials are those that, when dry, may be crumbled, pulverized or reduced to powder by hand pressure. Category I non-friable ACM includes packings, gaskets, resilient floor coverings and asphalt roofing products containing more than 1% asbestos. Category II non-friable ACM are any materials other than Category I materials that contain more than 1% asbestos.

Friable ACM, Category I non-friable ACM that will be subjected to drilling, sanding, grinding, cutting or abrading, and Category II non-friable ACM that is in poor condition and has become friable or that could be crushed or pulverized during anticipated renovation or demolition activities are considered regulated ACM (RACM). In the State of Utah, asbestos activities are regulated by the Utah Department of Environmental Quality (UDEQ), Utah Division of Air Quality (UDAQ) under Administrative Code R307-801 – Asbestos Rule. R307-801 requires that any asbestos-related activities conducted in the State of Utah, where more than three square feet or three linear feet of RACM will be disturbed, be conducted by personnel certified by the UDAQ. RACM must be removed prior to renovation or demolition activities which will disturb the materials. If the amount of RACM exceeds 260 linear feet (lf) of pipe insulation, more than 160 square feet (ft^2) on other building components, or will generate more than one 55-gallon drum of waste, the owner or operator must provide the UDAQ with written notification of planned removal activities at least 10 working days prior to the commencement of asbestos abatement activities. Removal of RACM must be conducted by a State of Utah-certified asbestos abatement contractor. Management Plans developed for the in-place management of asbestos-containing materials in AHERA-regulated facilities must be developed by a UDAQ-certified Management Planner.

The Occupational Safety and Health Administration (OSHA) Asbestos Standard for Construction (29 CFR 1926.1101) regulates workplace exposure to asbestos. The OSHA standard requires that employee exposure to airborne asbestos fibers be maintained below 0.1 asbestos fibers per cubic centimeter of air (0.1 f/cc).The OSHA standard classifies construction and maintenance activities that could disturb ACM, and specifies work practices and precautions that employers must follow when engaging in each class of regulated work. The standard also establishes requirements for handling materials containing less than or equal to 1%. States that administer their own federally-approved state OSHA programs may require additional precautions.

5.0 FINDINGS AND RECOMMENDATIONS

Based on the results of laboratory analysis, the following asbestos-containing material was identified:

- White gypsum board wall system (front office) – 2,207 square feet
- White gypsum board wall system (back production areas) – 9,400 square feet
- Green and white 9”x9” floor tile and associated black mastic– 1,100 square feet
- Blue floral pattern vinyl sheet flooring and black mastic – 82 square feet
- White window pane glazing – 266 linear feet
- Gray corrugated cement panel roofing – 335 square feet
- Black roofing flashing/penetration tar – 330 square feet

Cost estimates to remove the above listed materials are provided in Appendix 7.

6.0 UNIVERSAL, HAZARDOUS AND TOXIC WASTES SURVEY

In compliance with the Salt Lake County Health Department’s Solid Waste Management and Permitting Regulation #1, the Terracon inspector visually inspected the building to identify and quantify the following materials:

- Mercury-containing thermostats
- Mercury-containing fluorescent lights
- PCB-containing ballasts or transformers
- Refrigeration units containing chlorofluorocarbons (CFCs)
- Containers of liquid or hazardous waste
- Vehicle batteries

The hazardous materials survey was conducted by Mr. Larson and Mr. Dunbar on October 23, 2015. The following materials were visually identified, but no samples were collected for analysis.

6.1 Mercury-containing fluorescent lights

Mercury (Hg) is a toxic heavy metal and in its vapor form or liquid metal form may be present in switches and light bulbs. When a mercury device breaks, it releases mercury into the air, which is toxic to the human nervous system and can poison wildlife.

- Approximately 58 4-foot and 32 8-foot fluorescent light tubes were identified in light fixtures throughout the building.

6.2 Polychlorinated Biphenyls (PCB) Materials

Polychlorinated biphenyls, or PCBs, are a class of synthetic chemicals, once widely used by industry. Their physical properties made them ideal as insulating and cooling fluids in electrical equipment, such as transformers, light ballasts, and capacitors. The manufacturing of PCBs was banned in 1977.

- Approximately 60 suspect PCB-containing light ballasts were identified in light fixtures throughout the building.

6.3 Chlorofluorocarbons (CFC) Materials

CFCs are a group of materials that may harm the ozone layer. CFCs were used as refrigerants in various devices, such as refrigerators, air handlers, chillers, or freezers. CFCs must be removed prior to disposal or recycling of appliances by technicians who have been certified in an EPA-approved program. This requirement became effective in 1992.

- 2 refrigerator units were observed: one refrigerator and one HVAC compressor.

6.4 Containers of Liquid or Hazardous Waste

- Numerous containers of miscellaneous liquids (paint, cleaners, etc.) were observed in the building:
    - Numerous containers of chemicals used in the process of manufacturing circuit boards.

To the extent that future redevelopment plans for the area include building demolition, the above-noted materials should be properly disposed or recycled prior to demolition. A summary is provided in Appendix 8.

7.0 GENERAL COMMENTS

This asbestos and hazardous materials survey was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession currently practicing under similar conditions in the same locale. The results, findings, conclusions and recommendations expressed in this report are based on conditions observed during our survey of the building. The information contained in this report is relevant to the date on which this survey was performed, and should not be relied upon to represent conditions at a later date. This report has been prepared on behalf of and exclusively for use by Redevelopment Agency of Salt Lake City for specific application to their project as discussed. This report is not a bidding document. Contractors or consultants reviewing this report must draw their own conclusions regarding further investigation or remediation deemed necessary. Terracon does not warrant the work of regulatory agencies, laboratories or other third parties supplying information which may have been used in the preparation of this report. No warranty, express or implied, is made.

APPENDIX 2

CONFIRMED ASBESTOS-CONTAINING MATERIALS

Schovaers Electronics Facility
22 South Jeremy Street
Salt Lake City, Utah
Confirmed Asbestos Containing Materials

HA No.	Material Description	Material Location	% and Type Asbestos**	NESHAP Classification	Condition	Estimated Quantity*
01	White Gypsum Wallboard with Joint Compound and Tape	Front office	PC% 3.1 Chrysotile; PC% 4.3 Chrysotile; PC% 4.8 Chrysotile	Cat. II Non Friable	Good (No Damage)	2,207 Sq. Ft.
02	White Gypsum Wallboard with Joint Compound and Tape	Back production areas	PC% 3.5 Chrysotile	Cat. II Non Friable	Good (No Damage)	9,400 Sq. Ft.
03	Green/white 9" x 9" Floor Tile and Mastic	Front office under carpets and front office closets	PC% 3.5 Chrysotile; PC% 3.8 Chrysotile; PC% 5.6 Chrysotile; PC% 6.0 Chrysotile; PC% 6.4 Chrysotile	Cat. I Non Friable	Good (No Damage)	1,100 Sq. Ft.
07	Blue floral print Sheet Vinyl Flooring/Paper Backing and black mastic	Restrooms	PC% 2.1 Chrysotile; 20% Chrysotile	RACM Friable	Damaged	82 Sq. Ft.
09	White Window Pane Glazing	Throughout building	PC% 1.0 Chrysotile; PC% 1.1 Chrysotile	Cat. II Non Friable	Good (no damage)	266 Linear Ft.
14	Gray Cement Panels	Receiving dock roof	25% Chrysotile	Cat. II Non Friable	Good (No Damage)	335 Sq. Ft.
16	Black Roofing Flashing/Penetration Tar	Main roof perimeter flashings and penetrations	PC% 3.0 Chrysotile; PC% 3.1 Chrysotile	Cat. I Non Friable	Good (No Damage)	330 Sq. Ft.

***Estimated quantities** are based on a cursory field evaluation, and actual quantities may vary significantly, especially if asbestos-containing materials are present in hidden and/or inaccessible areas not evaluated as part of this survey.
****% & Type Asbestos** = this column contains both the analytical result of the sample with the highest concentration of asbestos detected in the samples that make up the HA and the types of asbestos identified.

The materials listed in this table have been sampled and determined to contain asbestos in concentrations greater than 1%. When disturbed, various federal, state and local regulations may apply. These materials should be monitored for damage over time and repaired as necessary by appropriately trained personnel. Removal may be necessary before renovations and in most cases before a demolition. See Appendix B for a summary of samples collected. See Appendix C for detailed analytical results.

Client: Terracon Consultants, Inc.
640 East Wilmington Ave
Salt Lake City UT 84106

Report Date: 11/16/2015
Report No.: 378568
Project: Schovaers Electronics
Project No.: AL127481T4C

BULK SAMPLE ANALYSIS SUMMARY

Lab No.: 5787203 **Description / Location:** White/Brown Sheetrock
Client No.: 01-WB1-01 Front Office, Southeast Corner

% Asbestos	Type	% Non-Asbestos Fibrous Material	Type	% Non-Fibrous Material
None Detected	None Detected	10	Cellulose	90

Lab No.: 5787203 **Description / Location:** White Joint Compound **Layer No.:** 2
Client No.: 01-WB1-01 Front Office, Southeast Corner

% Asbestos	Type	% Non-Asbestos Fibrous Material	Type	% Non-Fibrous Material
None Detected	None Detected	None Detected	None Detected	100

Lab No.: 5787203 **Description / Location:** Tan Joint Compound **Layer No.:** 3
Client No.: 01-WB1-01 Front Office, Southeast Corner

% Asbestos	Type	% Non-Asbestos Fibrous Material	Type	% Non-Fibrous Material
PC 3.1	Chrysotile	None Detected	None Detected	PC 96.9

Accreditations: **NIST-NVLAP No. 101165-0** **NY-DOH No. 11021** **AIHA-LAP, LLC No. 100188**

Analytical Method: US EPA 600/R-93/116 by Polarized Light Microscopy, (ELAP 198.1 where applicable)

Comments: Quantification at <0.25% by volume is possible with this method. (PC) Indicates Stratified Point Count Method performed. (PC-Trace) means that asbestos was detected but is not quantifiable under the Point Counting regimen. Analysis includes all distinct separable layers in accordance with EPA 600 Method. If not reported or otherwise noted, layer is either not present or the client has specifically requested that it not be analyzed (ex. analyze until positive instructions). Small asbestos fibers may be missed by PLM due to resolution limitations of the optical microscope. Therefore, PLM is not consistently reliable in detecting asbestos in non-friable organically bound (NOB) materials. Quantitative transmission electron microscopy (TEM) is currently the only method that can pronounce materials as non-asbestos containing.

Accreditations: **NIST-NVLAP No. 101165-0** **NY-DOH No. 11021** **AIHA-LAP, LLC No. 100188**

Analytical Method: US EPA 600/R-93/116 by Polarized Light Microscopy, (ELAP 198.1 where applicable)

Comments: Quantification at <0.25% by volume is possible with this method. (PC) Indicates Stratified Point Count Method performed. (PC-Trace) means that asbestos was detected but is not quantifiable under the Point Counting regimen. Analysis includes all distinct separable layers in accordance with EPA 600 Method. If not reported or otherwise noted, layer is either not present or the client has specifically requested that it not be analyzed (ex. analyze until positive instructions). Small asbestos fibers may be missed by PLM due to resolution limitations of the optical microscope. Therefore, PLM is not consistently reliable in detecting asbestos in non-friable organically bound (NOB) materials. Quantitative transmission electron microscopy (TEM) is currently the only method that can pronounce materials as non-asbestos containing.

Mr. Dunbar:

Re: Utah Asbestos Program Individual Certification Card

The Utah Division of Air Quality (DAQ) has reviewed your Utah Asbestos Program Certification Application for Individuals and we are pleased to inform you that your application has been approved. Your new asbestos program individual certification card is enclosed with this letter and this card is the sole method of individual certification documentation that you will receive from the DAQ.

Please check the information on your asbestos program certification card carefully. Please confirm that the photograph, name, and certification discipline(s) are correct. Also, please remember to keep your current asbestos program certification card with you at all times when you are performing regulated asbestos work activities.

If you have any questions regarding this letter or the enclosed asbestos program certification card, please contact Lisa Haroutunian at (801) 536-4007 or at lharoutunian@utah.gov.

Sincerely,

Robert W. Ford, Manager

APPENDIX 7

ASBESTOS ABATEMENT COST ESTIMATES

Schovaers Electronics Facility
22 South Jeremy Street
Salt Lake City, Utah
Estimated Abatement Costs – Asbestos

Homogeneous Area Number	Material	Location	Asbestos Content	Recommended Response Actions	Quantity Sq. Ft.	Approximate Abatement Cost
01	White Gypsum Wallboard with Joint Compound and Tape	Front office	PC% 3.1 Chrysotile; PC% 4.3 Chrysotile; PC% 4.8 Chrysotile	2	2,207 Sq. Ft.	$8,828.00
02	White Gypsum Wallboard with Joint Compound and Tape	Back production areas	PC% 3.5 Chrysotile	2	9,400 Sq. Ft.	$37,600.00
03	Green/white 9" x 9" Floor Tile and Mastic	Front office under carpets and front office closets	PC% 3.5 Chrysotile; PC% 3.8 Chrysotile; PC% 5.6 Chrysotile; PC% 6.0 Chrysotile; PC% 6.4 Chrysotile	1	1,100 Sq. Ft.	$5,500.00
07	Blue floral print Sheet Vinyl Flooring/Paper Backing and black mastic	Restrooms	PC% 2.1 Chrysotile; 20% Chrysotile	3	82 Sq. Ft.	$410.00
09	White Window Pane Glazing	Throughout building	PC% 1.0 Chrysotile; PC% 1.1 Chrysotile	2	266 Linear Ft.	$798.00
14	Gray Cement Panels	Receiving dock roof	25% Chrysotile	2	335 Sq. Ft.	$24,140.00
16	Black Roofing Flashing/Penetration Tar	Main roof perimeter flashings and penetrations	PC% 3.0 Chrysotile; PC% 3.1 Chrysotile	1	330 Sq. Ft.	$1,650.00
					Total	$78,926.00

1 = Category I non-friable asbestos-containing material that may be left in place during demolition activities provided that the material is in good condition and the NESHAP regulation is followed.

2 = Category II non-friable asbestos-containing material that may be left in place during demolition activities provided that the material is in good condition and the NESHAP regulation is followed.

3 = Regulated asbestos-containing material (RACM) that must be abated and removed from the building by a licensed asbestos abatement contractor.

4 = Less than one percent (<1%) asbestos-containing material. Does not require removal by EPA or State of Utah Division of Air Quality; however, OSHA worker exposure considerations apply during the work activities that will impact the material.

Note: Should the client request Terracon to write a specification document for the asbestos removal, conduct a bid walk, and manage the abatement, these services can be provided at an additional cost.

***** Price reflects the condition of the material being located underneath leveling compound or non-ACM floor tile and leveling compound

APPENDIX 8

HAZARDOUS MATERIAL SUMMARY
AND
SALT LAKE VALLEY HEALTH DEPARMENT'S
HAZARDOUS MATERIAL DISPOSITION FORM

Schovaers Electronics Facility
22 South Jeremy Street
Salt Lake City, Utah
Hazardous Materials Summary

Material	Location	Quantity	Approximate Removal Cost
4-foot Fluorescent light tubes	Throughout building	58 tubes	$140.00
8-foot Fluorescent light tubes	Throughout building	32 tubes	$154.00
PCB-containing light-fixture ballasts	Within fluorescent light fixtures	60 units	$720.00
CFC-containing refrigeration units	Breakroom and HVAC on roof	2 units	$400.00
Miscellaneous containers of paint, cleaners, gasses, and chemicals related to circuit board manufacturing	Throughout building	TBD	TBD
		Total	**$1,414.00**

Notes: Terracon can provide services to bid for removal of these items to local qualified contractors at an additional cost

PROJECT MANAGEMENT (A)

1.1 Project Task/Organization (A4)

Salt Lake County is responsible for overall implementation of the Schovaers Electronics Property Brownfields Assessment Project. Terracon will perform and coordinate site assessment activities. Identification of key personnel involved in the Salt Lake County Brownfields Assessment Grant project is provided in Section A4 of the Quality Assurance Project Plan (QAPP). Pertinent areas of this SAP as they relate to greater detail or reference in the EPA-approved *Community-Wide Quality Assurance Project Plan, Revision 1, Salt Lake County Brownfields Assessments (Terracon, April 25, 2017),* are indicated by QAPP designations in parentheses in section headers.

1.2 Problem Definition/Background (A5)

A Brownfield is a real property, the expansion, redevelopment, or reuse of which may be complicated by the real or potential presence of a hazardous substance, pollutant, or contaminant. Salt Lake County (the Grantee) is a recipient of an EPA community-wide assessment grant to inventory, characterize, assess, and conduct cleanup planning along with public outreach activities for eligible Brownfield sites located within County boundaries.

As part of the previous Salt Lake City North Temple Brownfields Assessment Grant, Terracon conducted a Phase I Environmental Site Assessment (ESA) on the Schovaers Electronics site (Terracon, 2015). In response to the Recognized Environmental Conditions (RECs) identified in the Phase I ESA, a Phase II ESA was performed under the grant by Terracon (Terracon, 2016). Currently a Phase I ESA is being performed by Terracon, and at this time is in a DRAFT format.

Salt Lake County requested that Terracon develop an Analysis of Brownfield Cleanup Alternatives (ABCA) for the site to assist with cleanup planning, under the Salt Lake County Brownfields Assessment Grant. Terracon determined additional data is needed to supplement the results of the initial Phase II ESA that was conducted during the Salt Lake City North Temple Brownfields Assessment Grant, and recommended that a SAP and additional Phase II be conducted to collect the additional information needed to develop an ABCA. This SAP pertains to and sets forth the proposed site assessment (Phase II) rationale, activities and field sampling locations for the Schovaers Electronics site. The SAP provides a discussion of specific site objectives, site description, and details regarding site-specific field sampling, and is designed is to be used in conjunction with the above-referenced QAPP. The QAPP

describes data collection procedures, analytical testing, QA/QC activities, and data evaluation processes to ensure that appropriate levels of data quality are obtained for field sampling, testing, and analytical activities.

1.2.1 Project Background

The site is an approximately 0.34-acre parcel (Parcel ID #15-02-204-007) addressed as 22 South Jeremy Street and owned by Schovaers Electronics. An approximately 6,000-square-foot industrial building occupies the site. An approximately 400-square-foot garage is present on the northwest side of the site. Paved parking areas are located to the east and north of the building. A small weedy area is present on the western boundary area. Schovaers Electronics has closed its business and the site is currently vacant. A previous investigation (Terracon, 2016), established a groundwater gradient across the property as being to the west-southwest. Depth to groundwater was encountered at 9 to 11 feet below ground surface (bgs).

Terracon conducted a Phase I Environmental Site Assessment (ESA) on the site (Terracon 2015). The Phase I ESA was compliant with Brownfields All Appropriate Inquiry and was performed in conformance with the scope and limitations of American Society for Testing and Materials (ASTM) Practice E1527-13 for the parcel located at 22 South Jeremy Street in Salt Lake City, Salt Lake County, Utah. The purpose of the Phase I ESA was to identify RECs in connection with the site, including the building and other improvements located on the site at the time of the reconnaissance. In conducting the current Phase I ESA, Terracon requested Salt Lake County provide any previous reports they are aware of for the site. The following reports were provided to Terracon for review.

- Phase I Environmental Assessments for Schovaers Electronics
  22 South Jeremy Street
  Salt Lake City, Salt Lake County, Utah
  Dated: August 31, 2015
  Prepared by: Terracon Consultants, Inc.
  For: Redevelopment Agency of Salt Lake City

- Phase II Environmental Site Assessment for Schovaers Electronics
  22 South Jeremy Street
  Salt Lake City, Salt Lake County, Utah
  Dated February 8, 2016
  Prepared by: Terracon Consultants, Inc.
  For: Redevelopment Agency of Salt Lake City

According to the Terracon 2015 Phase I ESA, the site was residential from at least 1898 to the mid-1900s. The residences were demolished and the current commercial building was constructed by 1962. The site building was originally occupied by an electrical supply

company and then a wholesale upholstery business before Schovaers occupied the building in 1977. Schovaers utilized the site to manufacture electric circuit boards.

Terracon's 2015 Phase I ESA identified the following on-site REC in connection with the site:

- **Impacts from adjoining properties:** The north adjacent property has documented improper disposal of 1,1,1, trichlororethane (TCA) very near or on the property line. This identified release represents a REC to the subject property.

- **Long-term industrial use:** The site has been an electroplating shop for approximately 38 years. Evidences of releases from these industrial operations were widespread and included leaking and spilling.

Terracon's 2015 Phase I ESA recommended a subsurface investigation to determine if the identified RECs have impacted the soils or groundwater at the site. Terracon conducted a Phase II ESA in 2016 to investigate the identified RECs. The Phase II ESA identified soil impacts from hexavalent chromium concentrations above industrial and/or residential RSLs in shallow soils within the upper 2 feet across the site. The highest concentrations (exceeding the industrial EPA RSL) were reported from samples collected along the western property boundary and at the northeast corner of the site (beneath pavement). Additional soil sampling was recommended to assess the depth and extent of the impact.

Groundwater beneath the site has been impacted by TCE in the western and northwest portion of the site. The highest concentrations of dissolved TCE (above MCLs and/or VISLs) are located west of the building, with the highest concentration adjacent to the building where historical chemical seepage from the Plate Shop reportedly occurred, leaving visible staining on the exterior walls of the building. Dissolved hexavalent chromium is also present in groundwater at concentrations below the MCL but above the Tapwater RSL. The highest concentrations of dissolved hexavalent chromium appear to be highest on the western side of the property. However, both TCE and hexavalent chromium were reported at sample locations along the northern property boundary. These results suggest that an off-site source of both VOCs and metals contamination may be present. To assess the source of TCE along the western part of the property, additional sampling within the confines of the building of both soil and groundwater will be performed to determine if a possible source is from past operations within the building.

Terracon's 2017 Phase I ESA (DRAFT) identified the following on-site RECs in connection with the site:

- Impacts from north-adjoining property: The north-adjoining property has been a plating shop for over 50 years. A Phase II Environmental Site

Assessment, February 8, 2016 and performed by Terracon, identified impacts to soil and groundwater were present at the site attributed to the historical operations on the property. Specifically, the presence of hexavalent chromium was found in soils that exceed the EPA RSLs for industrial use. The property was identified as a REC to the site.

- **Long-term industrial use:** The site has been an electroplating shop for approximately 40 years. Evidences of releases from these industrial operations were widespread and included leaking and spilling. Historical solvent uses, RCRA hazardous waste storage and disposal, wastewater discharge system, and staining are considered part of the long-term industrial use REC at the site.

- **Soil and Groundwater impacts at the site:** Based on Terracon's Phase II ESA, dated February 8, 2016, sampling at the site identified soil impacts of hexavalent chromium concentrations above industrial and/or residential Regional Screening Levels (RSLs) in shallow soils at depths between 1 and 2 feet bgs across the site. Groundwater has been impacted by trichloroethene (TCE) above Maximum Contaminant Levels (MCLs) and/or Vapor Intrusion Screening Levels (VISLs), and hexavalent chromium below MCL and above the tapwater RSL.

Terracon recommended an additional Phase II ESA to assess the vertical and horizontal extent of impacts to soils and groundwater at the site in order to develop remedial strategies and/or management plans for future re-development of the property.

1.2.2 Regulatory Standards and Criteria

The analytical results will be compared to the following regulatory guidance and standards:

- Soil – EPA Regional Screening Levels (RSL) guidance for residential and industrial use scenarios (November 2017);
- Groundwater – EPA RSL guidance for tapwater (November 2017), Utah Ground Water Quality Protection Standards (UGWQPS) (UAC-R317-6-2.1), Federal Maximum Contaminant Levels (MCLs), and EPA Vapor Intrusion Screening Levels (VISLs) (June 2017).
- Vapor – EPA OSWER Vapor Intrusion Assessment, Vapor Intrusion Screening Level (VISL) Calculator Version 3.5, June 2017.

1.3 Project/Task Description (A6)

The proposed Phase II scope of work described in this SAP is intended to gather the necessary data to bridge the gaps identified in the Terracon 2016 Phase II ESA, the Terracon

2017 Phase I ESA, and to aid with providing the information needed to develop an ABCA for the site.

1.3.1 Building Exterior Soll Borings

Two (2) exterior soil borings are proposed to assess the vertical extent of hexavalent chromium in soils. The previous investigation identified hexavalent chromium near the northeast and southwest corners of the property at concentrations that are greater than the EPA RSL for industrial sites. It was recommended that additional soil sampling be conducted in those two areas to assess the vertical extent of hexavalent chromium impacts in the soil column. **Exhibit 2** (**Appendix A**) depicts the proposed location of soil borings.

- Soil sampling will be conducted at two (2) locations on the exterior of the building. Soil samples will be collected at 2.5, 5, 7.5 and 10 feet below grade surface (bgs). Samples at depths of 2.5 and 5 feet will be analyzed and the other two will be put on hold at the lab pending results for the 2.5 and 5 foot samples. If the samples at 2.5 or 5 foot exceed the industrial RSL the two deeper soil samples will be analyzed.

1.3.2 Interior Soil Borings

To assess impacts to soil and groundwater associated with the historic use of solvents and metals within the building confines, it is proposed to advance seven (7) borings inside the building. Previously accessibility within the interior of the building was extremely limited due to the presence of heavy equipment and associated machinery. **Exhibit 3** (**Appendix A**) shows the proposed locations of interior soil borings.

- Conduct soil sampling at seven (7) locations within the interior of the building. Samples will be collected at a depth of 2 to 3 feet bgs and at the capillary fringe or obvious zone exhibiting signs of impacts.
- Collect one groundwater sample from each of the interior borings.

1.3.3 Sub-Slab Vapor Sampling

To assess the potential for vapor intrusion, sub-slab vapor sampling at four (4) locations is proposed. **Exhibit 3** (**Appendix A**) depicts the locations of the proposed sub-slab vapor sampling locations.

- Conduct sub-slab vapor sampling at four (4) locations within the interior of the building. Samples will be collected directly beneath the floor slab through a sub-slab vapor pin.

1.3.4 Project Schedule

The tentative project schedule is provided in the table below. Actual dates may vary depending on subcontractor availability.

Activity	Planned Start	Planned Completion
Soil and groundwater, sub slab vapor sampling	within 2-3 weeks following SAP approval	within 2-3 days following start of sampling
Laboratory analyses	within 1-2 days following sampling completion	within 2 weeks following start of laboratory analyses
Report preparation	within 1 week following receipt of analytical results	within 4 weeks following receipt of analytical results
EPA review of Report	within 1 week of receipt of draft report	within 2 weeks of receipt of draft report
Issue final Report	within 1 week of receipt of EPA comments on draft report	

*No field work will be conducted until formal EPA approval of the SAP is received by the agency and documented.

1.3.5 Field Work and Sample Collection

Field sampling will include advancement of nine soil borings to allow collection of subsurface soil and groundwater samples and four sub-slab vapor pins to allow collection of sub-slab vapor samples. This includes collecting 22 soil samples, seven groundwater samples and four sub-slab vapor samples. Field duplicates will be collected at rate of 10 percent with one trip blank (laboratory-supplied blank) per site. Therefore, one trip blank, two field duplicate soil samples, and one duplicate groundwater sample will be collected. Field duplicates for sub-slab vapor samples are not planned. Soil boring logs and field notes will be recorded during the field work. **Exhibits 2** and **3** (**Appendix A**) depicts the approximate proposed soil, groundwater, and soil vapor sampling locations. The proposed sample locations are designed to assess potential impacts associated with the on-site RECs and also to evaluate the overall extent of such impacts on the site.

Soil samples will be field screened with a photoionization detection (PID) to detect potential volatile organic vapors. Soil boring logs and field notes will be recorded during the field work. Exterior samples will be analyzed for hexavalent chromium (CrVI). Interior soil and groundwater samples will focus on volatile organic compounds (VOCs), the 13 Priority Pollutant metals, and hexavalent chromium (CrVI). Soil and groundwater pH will also be measured. Sub-slab vapor samples will be analyzed for VOCs.

Work will be conducted commensurate with the requirements set forth in the approved QAPP. Prior to mobilizing to the site to begin assessment activities, the property access agreement will be executed with the property owner, and the public utility location service (Blue Stakes of Utah) will be notified at least 48 hours prior to commencing any drilling activities. In addition, a private utility location service will be used to locate potential utilities or other subsurface obstacles in the immediate vicinity of each proposed drilling location.

1.4 Quality Objectives and Criteria (A7)

As discussed in the QAPP, Data Quality Objectives (DQOs) have been developed for sampling and analysis activities. DQOs identify the level of quality that the data must meet to provide a sound basis for decision-making activities during the project.

1.4.1 DQOs – Soil, Groundwater, and Soil Vapor Sampling

- **State the Problem:**
  According to the Phase I ESA, the site was residential from at least 1898 to the mid-1900s. The residences were demolished and the current commercial building was constructed by 1962. The site building was originally occupied by an electrical supply company and then a wholesale upholstery business. Since 1977, the building has been occupied by Schovaers Electronics, whose operations include electroplating. Use of the site as an electroplating facility for the past 38 years represents a REC to the site. In addition, improper disposal of 1,1,1-TCA was documented very near or on the property line on the north adjacent property (Crown Plating). Based on Terracon's Phase II ESA, dated February 8, 2016, sampling at the site identified soil impacts of hexavalent chromium concentrations above industrial and/or residential Regional Screening Levels (RSLs) in shallow soils across the site. Groundwater has been impacted by trichloroethene (TCE) above Maximum Contaminant Levels (MCLs) and/or Vapor Intrusion Screening Levels (VISLs), and hexavalent chromium below MCL and above the tapwater RSL. To support cleanup planning for redevelopment, additional information is needed regarding the vertical extent of hexavalent chromium in soil found in two areas on the exterior of the building, along with potential impacts beneath the building. . In addition, an assessment of the vapor intrusion potential from VOCs is needed to support cleanup planning.

- **Identify the decisions:**
  Determine whether soil or groundwater within the building confines have been impacted by hazardous substances, determine if current sub slab vapor concentration of VOCs exceed current EPA VISLs, and evaluate the vertical extent of hexavalent chromium in soils near the northeast and southwest corners of the property. Collect soil, groundwater, and soil sub slab vapor samples for laboratory analysis of the contaminants of concern (COCs) based on historical operations. Compare analytical data to relevant screening levels and determine what actions may be needed to support cleanup planning for redevelopment.

- **Identify inputs to the decision:**

Collect samples of soil, groundwater and sub slab vapor for analysis of COCs as detailed in Section 2.0 DATA GENERATION/ACQUISITION (B) of this SAP.

- **Define boundary of project:**
  The boundary of the study is limited to the Schovaers Electronics facility at 22 South Jeremy Street in Salt Lake City. Depth to groundwater was previously found at depths ranging from 9 to 11 feet bgs with a groundwater flow direction to the southwest. The exterior borings will be advanced to an approximate depth of 10 feet bgs within the site boundaries, at locations accessible to drilling equipment, at the approximate locations shown on **Exhibit 2** (**Appendix A**). Interior borings will be advanced to an approximate depth of 15 feet or 5 feet below the observed groundwater level, whichever is encountered first. Sub slab vapor samples will be collected within soils immediately below the floor slab.

- **Develop the decision rule:**
  Soil, groundwater and sub slab vapor samples will be collected at the approximate locations shown on **Exhibits 2** and **3** (**Appendix A**), for analyses as detailed within this SAP. Analytical results will be compared to the corresponding screening levels detailed in the attached tables.

  The data generated during this investigation will be compared to applicable screening levels including RSLs, MCLs, and VISLs. This evaluation will allow the development of remedial strategies, management plans, possible environmental restrictions and protective covenants providing necessary decision tools to aide in the property's re-development.

- **Specify limits on decision errors:**
  Sampling locations are biased towards locations where impacts are suspected. For this reason, the data are intended to represent a worst-case scenario for the site. Limited access for drilling and sampling equipment may introduce some level of uncertainty regarding the localized lateral extent of subsurface contamination, if present, at the identified features of concern. To reduce this uncertainty, the sampling design includes advancement of a sufficient number additional borings to define the overall extent of contamination, and to augment the results from the 2016 Phase II ESA. Decision errors will also be controlled by laboratory MDLs that are lower than the corresponding screening levels for various media as detailed in Tables 1A through 1C of this SAP. For a small percentage of analytes, cases may arise where a screening level is below the lowest practically attainable MDL and a "non-detect" value is reported. In such cases, the MDL will be compared to an alternate screening level for the same medium, where available, and/or the relative degree of uncertainty will be

stated with consideration of the presence or absence of other associated analytes within the same sample.

- **Optimize the design for obtaining data:**
  Based on the information obtained from the past investigation and the Terracon 2017 Phase I ESA, the proposed sampling locations and analytical program have been selected to augment the data from the 2016 Phase II ESA. This information is necessary to support cleanup planning.

1.4.2 Performance/Measurement Criteria

Performance and measurement criteria are detailed in Section A7 of the QAPP. Data quality indicators (DQIs) will be used to evaluate the performance and measurement criteria in terms of precision (analytical and/or total measurement error determination), accuracy, completeness, representativeness, and comparability. Anticipated concentrations of the parameters of interest are anticipated to range from levels below the method detection limits to concentrations that exceed the action levels.

1.4.3 Comparative Screening Levels

Soil, groundwater and soil vapor analytical results will be evaluated for residential as well as commercial/retail land use. **Tables 1A**, **1B** and **1C** (**Appendix B**) itemize the screening levels to be used for comparisons for each media to support project decisions regarding cleanup planning for redevelopment. For comparison of detected analytes that have multiple screening levels, the order of precedence of comparative screening levels will vary by media, contaminant type, and applicability.

The pH of the soil and groundwater will also be evaluated. Groundwater pH will be measured in the field, using standard calibrated equipment, and soil pH will be analyzed by the laboratory, using EPA Method 9045D. The UGWQPS for pH is between 6.5 and 8.5. Soil pH results will be compared to the EPA corrosivity screening thresholds for waste characterization (pH less than or equal to 2, or greater than or equal to 12.5).

Based on results from previous investigations, Terracon anticipates that arsenic concentrations in soil may exceed the RSLs but at relatively low levels that are typical of naturally occurring concentrations. If such RSL exceedances for arsenic in soil are identified, the potential need to address arsenic during cleanup will be further evaluated in the Phase II report and/or subsequent ABCA, and will depend upon on the identified arsenic concentrations and whether they are consistent with naturally occurring levels and compatible with planned land use.

The detection limits for soil, groundwater, and soil vapor samples will be in accordance with the established analytical methods. ESC Lab Sciences will perform the soil, groundwater,

and soil vapor analyses. The analytical methods and associated detection limits for each contaminant type are summarized in **Table 2** (**Appendix B**).

1.5 Specialized Training (A8)

Details of training and certification requirements are provided in Section A8 of the QAPP.

1.6 Documentation and Records (A9)

Details of documentation and recording procedures are provided in Section A9 of the QAPP.

2.0 DATA GENERATION/ACQUISITION (B)

2.1 Sampling Process Design (B1)

The sampling strategy for soil, groundwater, and soil vapor has been designed to assess the vertical and horizontal extent of impacts to soils or groundwater at the site in order to augment the previous data as needed to develop cleanup planning documents for the site. Exterior borings are designed to assess the vertical extent of hexavalent chromium in areas where concentrations during the previous investigation were reported above the EPA RSL's. The Interior borings are designed to assess the subsoil conditions below the building that were not investigated previously for the presence of metals, hexavalent chromium and VOC's in both soil and groundwater. Sub-slab vapor sampling will assess the potential for vapor intrusion within the footprint of the existing structure.

Nine (9) soil borings will be advanced on the site to allow collection of subsurface soil and groundwater samples, using direct-push drilling equipment. The proposed drilling and sampling locations are depicted on the Site Diagrams (**Exhibits 2** and **3**, **Appendix A**). A description of the sample types, sample naming convention, and laboratory analyses are presented in **Table 3A** (**Appendix B**) for the soil and groundwater samples and **Table 3B (Appendix B)** for the sub slab vapor samples.

The soil borings will be advanced to a maximum depth of approximately 15 feet bgs or to a sufficient depth to allow collection of groundwater samples, or until refusal, whichever occurs first. The exact location of each boring will be dictated by the drilling equipment's access constraints and safety. Such access constraints may include existing heavy shop equipment, subsurface utilities, limited working space, overhead ceiling clearances, and other obstacles associated with the facility operations. Wherever possible, off-set boring locations will be biased such that they are placed on the presumed down-gradient side (west or southwest) of any feature of concern that is inaccessible.

After sample collection is completed, each boring will be properly abandoned by backfilling with bentonite clay pellets, adding water to hydrate the bentonite clay, and restoring the

surface with native soil, asphalt, or concrete patch as appropriate to match the surrounding area. Samples will be delivered to the analytical laboratory within holding times for all analytical methods to generate definitive analytical data, which are critical to this assessment.

Site-specific conditions may require an adjustment to the field program and a deviation from this SAP to accommodate site-specific needs. If an adjustment or deviation becomes necessary, the activities and reasoning will be documented and implemented. The Salt Lake County Brownfields Grant Project Manager, and EPA Project Officer, and UDEQ-DERR will be notified if the adjustment is determined to be a significant one. Such adjustments (for example, adjustments in sampling locations) may introduce some degree of variability, which will be reconciled with project information by evaluating whether contaminant levels may be underestimated or overestimated, and how this may affect eventual site management or cleanup approaches, if applicable.

Tables 3A and **3B** (**Appendix B**) provide a summary description of the proposed sample locations, sample types, sample naming convention, and laboratory analyses. Field duplicates will be collected at rate of 10 percent with one trip blank (laboratory-supplied blank) per site. Therefore, one trip blank, two field duplicate soil samples, and one duplicate groundwater sample will be collected. Field duplicates for sub-slab vapor samples are not planned.

2.2 Sampling Methods (B2)

2.2.1 Soil Sampling

Soil samples will be collected from direct-push borings following the procedures detailed in *Standard Operating Procedure (SOP) 5, Geoprobe Sampling*, which is provided in Appendix B of the EPA-approved QAPP. During advancement of the borings, soils will be logged as detailed in *SOP 1, Soil Sampling and Logging,* provided in Appendix B of the EPA-approved QAPP.

- Sample locations SE-SB-16 and SE-SB-17 (Exterior): Four soil samples will be collected from each boring at the predetermined depths of2.5', 5', 7.5' and 10' bgs for vertical delineation of hexavalent chromium in soils.

- Sample Locations SE-SB-18 through SE-SB-24 (Interior): Two soil samples will be collected from each boring. One soil sample will be collected from soil exhibiting the most elevated PID readings. If no elevated PID reading is observed, one sample will be collected within 2' to 3' below the floor slab and the second at 8' bgs, or from the interval most likely to contain environmental impacts as determined in the field by the sampling professional.

2.2.2 Groundwater Sampling

Groundwater samples will be collected from the seven (7) interior direct-push borings following the procedures detailed in SOP 5, *Geoprobe Sampling*.

2.2.3 Sub-Slab Vapor Sampling

Sub-slab vapor samples will be collected from vapor pins installed within the concrete floor slab. Installation of the vapor pins and collection of the samples is described in detail in SOP-E.2120, Soil Gas Sampling – Sub-slab pin method located in Appendix B of this SAP.

2.3 Sample Handling and Custody (B3)

Details of sample handling and custody are provided in Section B3 of the QAPP.

2.4 Analytical Methods (B4)

Details for analytical methods are provided in Section B4 of the QAPP.

2.5 Quality Control (B5)

Details for quality control are provided in Section B5 of the QAPP.

2.6 Instrument/Equipment Testing, Inspection, and Maintenance (B6)

Requirements for instrument and equipment testing, inspection, and maintenance are provided in Section B6 of the QAPP.

2.7 Instrument/Equipment Calibration and Frequency (B7)

Requirements for instrument and equipment calibration and frequency are provided in Section B7 of the QAPP.

2.8 Inspection/Acceptance for Supplies and Consumables (B8)

Details for inspection and acceptance for supplies and consumables are provided in Section B8 of the QAPP.

2.9 Use of Existing Data (Non-direct Measurements) (B9)

Details for use of existing data are provided in Section B9 of the QAPP.

2.10 Data Management (B10)

Details for data management are provided in Section B10 of the QAPP.

3.0 ASSESSMENT AND OVERSIGHT (C)

3.1 Assessments and Response Actions (C1)

Details for assessment and response actions are provided in Section C1of the QAPP.

3.2 Reports to Management (C2)

Reporting requirements are provided in Section C2 of the QAPP.

4.0 DATA VALIDATION AND USABILITY (D)

4.1 Data Review, Verification, and Validation (D1)

The Terracon Project Manager will be responsible for data management on this project. Details for data review, verification, and validation is provided in Sections D1, D2, and D3 in the QAPP.

4.2 Verification and Usability Methods (D2)

Data collected during this project will be collected according with this SAP and the QAPP. Details for data review, verification, and validation are provided in Sections D2 and D3 in the QAPP.

Northeast part of building (interior of building)	Assess vapor intrusion potential	SE-VP-2	SG	VOCs[a]
Adjacent to sewer lateral (interior of building)	Assess vapor intrusion potential	SE-VP-3	SG	VOCs[a]
Plate Room (interior of building)	Assess vapor intrusion potential	SE-VP-4	SG	VOCs[a]

a – volatile organic compounds.
SG – Soil gas

APPENDIX C

TERRACON BROWNFIELDS STANDARD OPERATING PROCEDURES

E.2120
SOIL GAS SAMPLING – SUBSLAB PIN METHOD
(Replaces former E.2100)

Last Revision/Review: March 2014
Reviewer/Office: DEK/Corporate

Objective

The objective of subslab or subfloor soil gas/vapor sampling is to provide an estimate of the concentration of vapors that may be released by subsurface soils and potentially enter pathways that could produce airborne exposures to receptors in buildings or structures. The purpose of this document is to provide guidance and recommended standard practices for conducting sub-slab soil gas sampling to Terracon personnel.

Many states have vapor encroachment, vapor intrusion and/or soil gas sampling guidance documents with specific requirements or recommended procedures for soil gas sampling. State-specific requirements and guidance supersede this guidance document and Terracon personnel should adhere to the most current state-specific guidance when conducting soil gas investigations. If state-specific requirements are less stringent than the procedures recommended in this guidance, it is recommended that the procedures in this guidance be utilized.

For states where specific vapor encroachment, vapor intrusion and/or soil gas sampling regulations or guidance are not in place, Terracon personnel should consult this guidance document and the recommended standard practices herein.

This application involves effects on indoor air quality (i.e., borings are beneath an occupied or potentially occupied structure), sampling requires the participation / review of a Terracon industrial hygienist (IH) in selecting methods and scoping work. Engaging an IH is encouraged in addressing any airborne contaminants. For direction to local or regional technical assistance, contact the Chair of the Industrial Hygiene Practice Resource Group on the Environmental Services Terranet webpage. Click here if viewing electronically.

Implementation

The *Guidance Document* provides basic guidelines and field procedures for conducting subslab or subfloor soil gas vapor sampling. Subslab soil gas data from samples collected under the building slab and within the advective envelope of the building-driven pressurization or depressurization indicates whether contaminants have accumulated directly under the building.

This is Terracon's preferred method for soil gas evaluation for sites with existing buildings with foundations above the water table.

Procedures

Since 2013, Terracon addresses all soil gas and subslab soil vapor sampling through special guidance prepared by the Vapor Encroachment/Intrusion Committee. Staff should use Terracon's *Soil Gas Investigation Guidance Document (Version 1.0, August 7, 2013)*, or most current version. This document is available on the Environmental Services Terranet webpage. Click here if viewing electronically.

Procedures shall be as specified in *4.0 SUBSLAB SOIL GAS SAMPLING PROTOCOL* of the *Guidance Document*.

Quality assurance and quality control procedures should be incorporated into property-specific sampling and analysis plans from 5.0 LEAK DETECTION AND QA/QC of the *Guidance Document*.

The *Guidance Document* must be attached to this TSOP for field use.

APPENDICES

Appendix A – Soil Gas Implant Method: Equipment/Materials List, Procedures, and Field Data Form

Appendix B – Post-Run Tubing Method: Equipment/Materials List, Procedures, and Field Data Form

Appendix C – Subslab Soil Gas: Equipment/Materials List, Procedures, and Field Data Form

Appendix D – Available Soil Gas Analytical Methods

Appendix E – References

1.0 INTRODUCTION AND PURPOSE

Vapor encroachment is defined as vapor-phase migration of volatile organic compounds (VOCs) onto a property from underlying contaminated groundwater, soil, non-aqueous phase liquid (NAPL), and/or soil gas. Vapor intrusion is defined as vapor-phase migration of VOCs into occupied buildings from underlying contaminated groundwater, soil, NAPL, and/or soil gas.

Soil gas surveys provide information on the soil atmosphere that can aid in assessing the presence, composition, source, and distribution of contaminants. Soil gas and subslab soil gas data are important components of vapor encroachment and vapor intrusion investigations and are central to the evaluation of the potential for vapor intrusion, as outlined in U.S. EPA guidance and various state guidance documents.

1.1 Purpose and Intent

The purpose of this document is to provide general guidance and recommended standard practices for conducting soil gas sampling to Terracon personnel. Many states have vapor encroachment, vapor intrusion and/or soil gas sampling guidance documents with specific requirements or recommended procedures for soil gas sampling. State-specific requirements and guidance supersede this guidance document and Terracon personnel should adhere to the most current state-specific guidance when conducting soil gas investigations. If state-specific requirements are less stringent than the procedures recommended in this guidance, it is recommended that the procedures in this guidance be utilized.

For states where specific vapor encroachment, vapor intrusion and/or soil gas sampling regulations or guidance are not in place, Terracon personnel should consult this guidance document and the recommended standard practices herein.

1.2 Limitations

Limitations and topics excluded from this guidance are as follows.

- This guidance does not include the collection of indoor air samples for vapor intrusion assessments. If indoor air sample collection is warranted on your project, please contact one of the members of the Vapor Encroachment/Intrusion Committee (refer to Section 1.3) and consult with a Terracon Certified Industrial Hygienist (CIH) that has the requisite indoor air sampling experience.
- An Authorized Project Reviewer (APR) with vapor encroachment and/or vapor intrusion experience must be assigned to and participate in the project from proposal preparation through completion.

- This guidance only includes active soil gas sample collection methods. Passive soil gas sampling methods do not yield truly quantitative results; however, they can be useful as a screening tool or to delineate affected zones. If you are considering the use of passive soil gas methods, please contact one of the members of the Vapor Encroachment/Intrusion Committee.
- As noted above, state-specific requirements and guidance supersede this guidance document.
- This guidance document only covers soil gas investigation and sampling and does not address the evaluation of soil gas sampling data for vapor intrusion evaluations. Due to the various data evaluation approaches currently being utilized in the industry, contact one of the members of the Vapor Encroachment/Intrusion Committee for assistance with data evaluation if there are no specific risk-based levels or criteria established for your state.

This guidance is not intended to be an all-inclusive guide to soil gas sampling, but rather to provide standard guidelines and recommended practices. There are various resources and guidance documents that cover vapor intrusion and soil gas sampling in depth. Refer to Appendix E for a list of useful references.

1.3 Vapor Encroachment/Intrusion Contacts

Questions concerning soil gas investigations, data evaluation, indoor air sampling, vapor intrusion assessments, or vapor mitigation, can be directed to one of the below-listed Terracon employees.

- Mike Hagemeister: Omaha NE, mehagemeister@terracon.com (Investigation and Mitigation)
- Matt Hall: Nashville TN, mbhall@terracon.com (Investigation and Mitigation)
- Michael Hudgins: Columbia SC, pmhudgins@terracon.com (Investigation and Mitigation)
- Scott Kolodziej: Dallas TX, smkolodziej@terracon.com (Investigation and Due Diligence)
- John Sallman: Corporate, jbsallman@terracon.com (Investigation and Due Diligence)
- Craig Eaton: Salt Lake City UT, cdeaton@terracon.com (Investigation and Due Diligence)
- David Wolfgram: White Bear Lake MN, djwolfgram@terracon.com (Investigation)
- Michael Crandall: Tempe AZ, mscrandall@terracon.com (CIH, Indoor Air Sampling)

A list of additional Vapor Encroachment/Intrusion Committee members and vapor encroachment/intrusion guidance resources are available on the SharePoint site on TerraNet (http://sp.terracon.com/ServiceLines/Env_New/VI/Pages/default.aspx).

2.0 SOIL GAS INVESTIGATION SCOPE DEVELOPMENT

2.1 Evaluation of Existing Data and Conceptual Site Model

The preparation of a conceptual site model (CSM) is part of all site investigations and begins in the proposal stage. The purpose of a CSM is to provide a conceptual understanding of the potential for exposure to hazardous contaminants at a site based on the sources of contamination, the release mechanisms, the transport media, the exposure pathways, and the potential receptors. The CSM relates the source of contamination to human and ecological receptors and identifies potential sources of contamination, the potentially contaminated media, and exposure pathways.

The level of detail in the CSM will depend upon the project and client objectives, and the requirements of the APR. In all circumstances, the CSM must contain sufficient detail so that field staff, the project manager, and the APR have a clear understanding of site conditions and how they relate to meeting the project objectives.

The following items should be included in a CSM for the vapor encroachment and/or intrusion pathway. In the early stages of investigation, each of the components listed may not be necessary. These may be added as applicable.

- Primary Sources of Contamination – For each potential contaminant source, describe what potentially caused the contamination and provide a list of chemicals released (either known or suspected) into the environment.
- Primary Release Mechanism – For each potential contaminant source, describe the means by which the release, or suspected release, is thought to have occurred.
- Secondary Sources of Contamination – Include the environmental media potentially contaminated or known to be contaminated by the primary sources, such as surface soil, subsurface soil, and groundwater.
- Contaminant Transport Mechanisms – For each potentially-contaminated medium, describe the transport mechanism (usually advection and diffusion through the vadose zone) for contaminant vapors to enter the property (vapor encroachment) or for contaminant vapors to enter the indoor air (vapor intrusion), and describe the characteristics of the subsurface including the site geology and depth to shallow groundwater. *Also consider whether any preferential contaminant migration pathways, such as sewer or utility lines, are present.*
- Exposure Routes – Describe current buildings, potential future building scenarios, as appropriate, and areas where vapors may accumulate. Discuss each potential preferential contaminant migration pathway associated with the buildings, such as foundation cracks, voids, utility ports, pipes, elevator shafts, sumps, and drain holes.

- Building Effects – For in-depth vapor intrusion investigations, evaluate the effects of the overlying building on vapor intrusion and associated dynamics. This evaluation may include measurements of differential pressures across the floor slab, determination of air exchange rates, and evaluation of temporal effects due to changes in the building HVAC system operation. (Note: This level of evaluation is not expected for limited, presence/absence vapor intrusion investigations conducted during property due diligence.)
- Potential Receptors – List each of the current and potential future receptors, as appropriate, that could potentially contact affected soil gas and/or indoor air.

To document current site conditions, a CSM may be supported by maps, subsurface cross-sections, site diagrams, and any other property/site specific details that may be pertinent. The narrative description should clearly describe known site conditions and state what assumptions were made to generate the CSM. As additional data are collected and analyzed through the evaluation of the vapor encroachment and/or intrusion pathways, the CSM should be updated.

Additional information on the development of a CSM can be found in guidance published by U.S. EPA, Risk Assessment Guidance for Superfund (RAGS, Part A, 1989), Standard Guide for Developing Conceptual Site Models for Contaminated Sites, ASTM E1689 - 95(2008), and/or U.S. EPA Data Quality Objective guidance.

2.2 Preparing a Soil Gas Sampling Plan/Proposal

A soil gas sampling plan/proposal should be site-specific and designed to meet the project objectives. The soil gas sampling plan/proposal should be prepared after evaluation of existing site information and analytical data. Also utilize the CSM to assist in developing a soil gas sampling strategy. The following items should be considered when developing a soil gas sampling plan/proposal:

- Selection of an appropriate Terracon APR
- Objectives of the study.
- Chemicals of concern (COCs) including parent and breakdown products. Note that the list of soil gas COCs should be consistent with the list of COCs analyzed in groundwater and/or soil if the assessment is being conducted as part of an LSI. This is an important consideration because "full VOC scan" lists can include different chemicals depending on the laboratory used, media analyzed, and analytical methods. A target COC list should be developed based on the type of source (e.g., dry cleaner or gas station) and the COCs detected in on-site soils or groundwater.
- Physical site characteristics (*e.g.*, soil type, depth to groundwater, water table fluctuations, building construction, etc.)

- Possible preferential pathways, including subsurface utilities and lithology (e.g., coarse-grained soils, shrink/swell clays with cracks, and fractured bedrock).
- Land use, building characteristics, and potential receptor population.
- Need for vertical profiles to assess potential biodegradation/attenuation.
- Appropriate soil gas probe installation and sampling protocols.
- Number, location and analytical method for soil gas samples to satisfy the project objectives.
- Appropriate QA/QC protocols, such as leak testing, sample duplicates, detection limits and limitations, and equipment blanks based on the project objectives and sensitivity.

Soil gas sampling proposal and work plan templates are available for reference on the vapor intrusion page on SharePoint/TerraNet.

http://sp.terracon.com/ServiceLines/Env_New/VI/Pages/default.aspx

2.3 Selection of Sample Locations

Proper sample locations will vary based on site-specific conditions and project objectives. For this reason, soil gas sampling plans and proposals are to be reviewed by an Authorized Project Reviewer (APR) with vapor encroachment and/or vapor intrusion expertise. For assistance with selecting the proper sampling locations for your site, contact one of the vapor encroachment/intrusion contacts in Section 1.3 of this guidance. General guidelines are presented below.

Buildings Present

For commercial properties with buildings above or in close proximity to impacted soils or groundwater, soil gas samples should be taken under the building (i.e., subslab sampling) due to the potential for vapor accumulation under the foundation and/or lowest level floor slab. Though plans are often not available, the building construction should be evaluated for potential non-uniform distribution of vapor accumulation (e.g., grade beam construction or multiple additions that may affect the distribution of vapors under various parts of the building). Subslab soil gas is also considered to best represent soil gas that has the potential to enter the overlying building and create a vapor intrusion condition, and is less susceptible to seasonal variations. If it is not practical to collect soil gas samples under the building, then the samples should be collected as close to the building as possible, while also taking into account: 1) proximity to the source of contamination; 2) depth of the foundation, lowest level floor slab, or basement; and 3) the areas with the highest potential for elevated soil gas concentrations based on the existing data and CSM.

Vacant Properties

For vacant properties where a building is proposed, soil gas samples should generally be collected within the proposed building footprint at locations that have the highest potential for soil gas impacts based on review of the existing data, the proposed building construction (e.g., slab penetration points, areas where vapors could accumulate, etc.) and the CSM. For vacant properties without a proposed development, soil gas samples should be collected from the locations with the highest potential for soil gas impacts based on review of the existing data and the CSM. Since the effects of the future overlying building on soil vapor COC distribution and dynamics are unknown when evaluating vacant properties, the sample depths should be located near the VOC source to represent reasonable worst-case conditions.

2.4 Selection of Sample Depths

Proper sample depths will vary based on site-specific conditions and project objectives. For this reason, soil gas sampling plans and proposals are to be reviewed by an Authorized Project Reviewer (APR) with vapor encroachment and/or vapor intrusion expertise. For assistance with selecting the proper sampling depths for your site, contact one of the vapor encroachment/intrusion contacts in Section 1.3 of this guidance. General guidelines are presented below.

Shallow Soil Gas Sampling Depth

Shallow soil gas is defined by the EPA OSWER SVIG Guidance as soil gas within 5 feet below grade surface (bgs). It is recommended that shallow soil gas samples be collected from depths ranging from 3 to 5 feet bgs. Collection of exterior shallow soil gas samples at depths less than 3 feet bgs increases the potential for "short-circuiting" with atmospheric air and also increases the potential for spatial and temporal variability (See Section 2.6). If exterior shallow soil gas samples are collected, then the leak detection protocols outlined in Section 5 of this guidance should be followed.

Research has shown that shallow soil gas samples collected along the perimeters of buildings often do not represent the concentrations of VOCs in the sub-slab soil gas due to effects of the overlying building on soil vapor COC distribution. In these cases, exterior soil gas samples collected near the source of subsurface contamination better represented sub-slab VOC concentrations. If exterior soil gas sampling must be conducted in lieu of sub-slab sampling for existing buildings, the sampling depth should be positioned near the source of VOCs.

Note: PID readings collected during soil gas probe advancement can be utilized to select the worst-case depth interval for placement of the sampling tip. If the soil gas probe advancement method does not generate soil cuttings for PID readings, such readings can be collected from a co-located soil boring in the vicinity of the soil gas probe so long as the soil boring is adequately plugged with hydrated bentonite or grout and the proper soil gas probe equilibration time is utilized.

Deep Soil Gas Sampling Depth

Sampling depths for deep soil gas samples (i.e., samples collected at depths greater than 5 feet bgs) will vary based on the project objectives. To obtain worst-case scenarios for soil gas concentrations, these samples should be collected in or proximate to the source(s) of contamination. When underlying groundwater and/or NAPL are the source of vapors, soil gas samples should be collected from immediately above the capillary fringe zone or NAPL.

For sites with existing or proposed basements, the soil gas probe/sampling tip should be advanced to a depth near the source of VOCs.

Additional soil gas samples may be collected throughout the soil profile to assess vapor distribution and possible bioattenuation at the site. As noted above, PID readings from soil cuttings can be utilized to select the worst-case depth interval for placement of the sampling tip(s).

Sub-Slab Soil Gas Samples

Sub-slab soil gas samples should be collected from the gravel or sand bedding material underlying the building slab. This is typically accomplished by drilling the sample port through the slab and into the bedding material, followed by placement of sample tubing that terminates within the slab (refer to Section 4.1).

2.5 Selection of Analytical Methods and Sample Containers

The most common and widely-accepted method for the analysis of VOCs in soil gas is EPA Method TO-15; however, there are various EPA methods and modified EPA methods currently utilized in the industry. The modified methods may offer significant cost savings over EPA Method TO-15. Refer to Appendix D for a table of the available soil gas analytical methods and typical cost ranges. *When selecting analytical methods, ensure that they are compatible with state regulations and guidance.*

When selecting an analytical method, there are two important things to remember:

1) Ensure the analytical method is appropriate for use in the state or jurisdiction in which the work is being conducted; and

2) Have the laboratory provide the method detection limits to ensure that they are sensitive (low) enough to compare the resulting data to the applicable regulatory risk-based screening levels.

The most common options for soil gas sample collection are Tedlar® bags and Summa canisters. Due to limited hold times associated with Tedlar® bags and research showing possible breakthrough and/or absorption of COCs, the use of Tedlar® bags is not recommended for Terracon soil gas investigations.

Summa canisters are recommended for use on Terracon soil gas investigations. Summa canisters are available in various sizes, with the most common sizes for soil gas sample collection being 6 liters (L) or 1 L. In many cases, 1-L Summa canisters are sufficient for the laboratory to obtain the desired detection limits for soil gas analysis. These smaller canisters are easier to use in the field and easier to package and ship. Refer to Figure 1 for a diagram of a Summa canister and associated flow regulator.

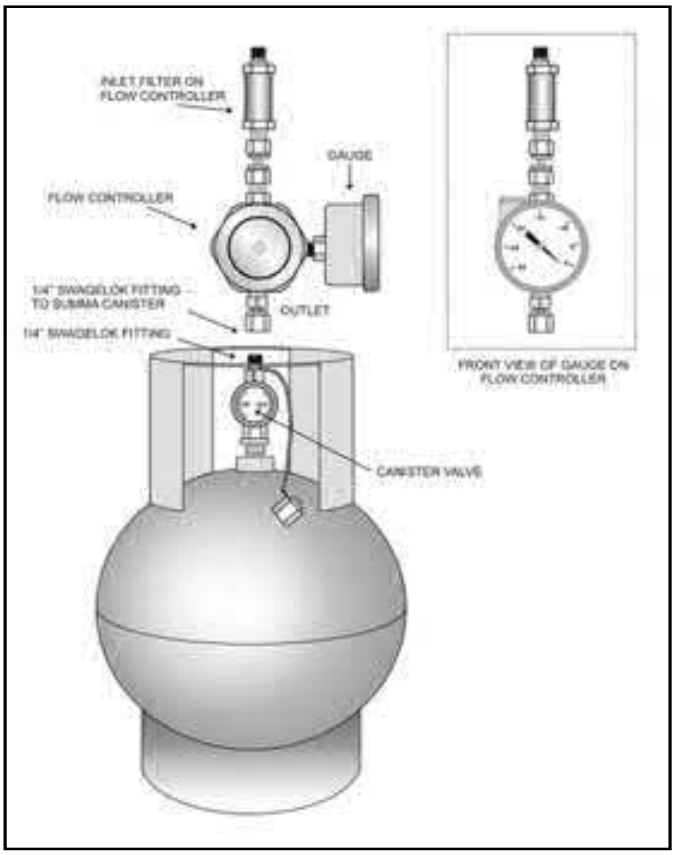

Figure 1: Typical Summa Canister Setup (Source: Ohio EPA, *Sample Collection and Evaluation of Vapor Intrusion to Indoor Air*, May 2010)

Summa canisters should always be provided by the laboratory and should at least be batch-certified as clean by the lab. The typical frequency for laboratory batch-certification of Summa canisters is one confirmatory analysis per 10 canisters. If a higher level of confidence is required based on the project objectives or sensitivity, contact the analytical laboratory about obtaining individually-certified clean Summa canisters.

When utilizing Summa canisters for sample collection, it is important that the canister vacuum be recorded: 1) immediately upon opening the canister and beginning sample collection; 2) at the end of sample collection; and 3) after receipt by the analytical laboratory. If the initial vacuum reading after opening a Summa canister does not indicate the canister is under full vacuum (typically 30 inches Hg of vacuum), do not utilize the container for sample collection. It is possible that vacuum was partially lost during shipment and that ambient air may have been introduced into the sample container. This is not an uncommon occurrence; therefore, it is suggested that at least one extra (i.e., back-up) Summa canister be ordered for a given sampling event. Options to handle this are further discussed in Section 3.3 of this guidance.

2.6 Consideration of Environmental Factors and Temporal Variability

Three common environmental factors can influence the results of a soil gas survey and should be considered when conducting a project. Following is a brief discussion of each:

- Temperature can have an effect on soil gas concentrations since both vapor pressure and water solubility are temperature dependent. However, temperature variations decrease with depth in the soil column and are unlikely to have a large influence on concentrations at five feet below grade or greater. In areas with large seasonal temperature variations, the most conservative values will be those collected in the summer months.
- Barometric Pressure can lead to a pressure gradient between the soil vapor and the atmosphere, resulting in the movement of soil vapors out of the vadose zone during barometric lows and the movement of atmospheric air into the vadose zone during barometric highs. The potential affects decrease with sampling depth.
- Precipitation and resulting infiltration can potentially impact soil vapor concentrations by displacing the soil vapor, diluting VOC concentrations locally, and/or creating a cap above the soil vapor. However, soil gas samples collected at depths of greater than three feet are unlikely to be significantly affected. *As a conservative measure, it is recommended to wait at least 48 hours after a significant rainfall (>1 inch) before proceeding with soil gas sampling.* The wait time prior to sampling will vary based on the soil type and associated soil drainage curves (refer to Appendix G of the California EPA *Advisory – Active Soil Gas Investigations*, dated April 2012). It is also recommended that irrigation, if applicable, be stopped at least 5 days prior to soil gas sampling.

The above environmental factors and other factors often contribute to seasonal or temporal variability in soil gas concentrations in the vadose zone. These variations are generally reduced when collecting soil gas samples from beneath existing impermeable surfaces such as garage floors, patios, parking lots, or roads, etc.

It is understood that project schedules for Terracon soil gas investigations conducted as part of due diligence may not allow for multiple sampling events to evaluate temporal variation. In these cases, the resulting data should be evaluated and qualified in the report with the understanding that fluctuations in concentrations could occur.

When the project schedule allows or when a more thorough evaluation of soil gas is warranted based on project objectives or sensitivity, two or more rounds (quarterly or semi-annual) of soil gas data should be collected. This will allow evaluation of temporal and seasonal variations at the site and other site-specific factors which may influence the migration of vapors. The maximum concentrations detected should be used to evaluate risk.

2.7 Evaluating Preferential Migration Pathways

Preferential pathways for vapor migration in the subsurface can be either natural or anthropogenic. Examples of preferential pathways include but are not limited to fractures, macropores, coarse-grained soils, gravel base for utility conduits, and subsurface drains.

A survey should be conducted to evaluate potential preferential vapor migration pathways. Underground utility lines can be important preferential migration pathways for vapors and can allow contaminants to migrate significant distances from source areas. The survey should evaluate underground utilities such as water, sewer, gas, electric, and telecommunication lines. Sources of information for the preferential pathway survey may include: site walkovers, geo-databases, construction blueprints, utility maps, Sanborn maps, historical aerial photos, interviews, utility companies, regulatory files, etc. Fill material and sand lenses or macropores in clay materials may also act as preferential pathways. Soil gas sampling locations should be scoped to assess possible preferential migration pathways.

3.0 SOIL GAS SAMPLING PROTOCOL

The following section provides basic guidelines and field procedures for conducting soil gas sampling using soil gas implants or post-run tubing (PRT) methods.

3.1 Soil Gas Implant Installation

Soil gas implants generally consist of a sampling point (stainless-steel, ceramic, or plastic) set at a specific depth within a borehole. This sampling point is connected to tubing that leads to a permanent or semi-permanent completion at the surface. The zone surrounding the sampling point is filled with sand and the remainder of the borehole is filled with hydrated bentonite with the option of grout for the surface completion. Refer to Figure 2 for a general schematic of a permanent soil gas implant. A field equipment/materials checklist, list of procedures, and field data form for this process are included in Appendix A. When installing soil gas implants in clayey soils, consider the potential for borehole smearing and utilize techniques to minimize or mitigate smearing. Contact a Vapor APR or Investigation/RBCA PRG member for advice on such techniques.

General installation procedures are as follows:

1) Advance the borehole to the desired depth using a selected standard drilling method (e.g., hand auger, direct-push, solid flight auger, or hollow stem auger);

2) Connect the sampling point to the sample tubing and lower the point to the desired sample depth;

3) Backfill the zone surrounding the sampling point (recommended 1 to 2 foot interval) with 20/40 grade silica sand;

4) Place at least 6 inches of dry, granular bentonite above the sand pack to prevent hydrated bentonite from infiltrating the sand pack;

5) Backfill the borehole with hydrated bentonite or bentonite grout (at least from near grade surface to 2-3 feet bgs recommended);

6) Construct a semi-permanent or permanent surface completion in accordance with state regulations for monitoring wells and sampling points and connect a shut-off valve to the end of the tubing; and

7) Collect soil gas samples in accordance with Section 3.3 of this guidance.

As depicted in Figure 2 (Page 13), soil gas implants can be installed at different depths within the same borehole to evaluate soil gas concentrations across the soil profile so long as hydrated bentonite seals are placed between the sanded intervals containing the sampling points. Consult with a member of the Vapor Encroachment/Intrusion Committee when using nested soil gas points/implants with multiple sampling depths.

Soil gas sampling points may also be installed using direct-push sampling equipment with expendable points and specialized tooling designed to deliver sampling points to the desired depth. Various subcontract and in-house drillers now have this tooling and are experienced with soil gas sampling point installation.

Method Pros:

- Can install nested points;
- Permanent or semi-permanent points allow for collection of additional samples for evaluation of temporal or seasonal variation;
- Can be done using hand auger equipment;
- Materials are relatively inexpensive; and
- Compatible with leak detection procedures (helium shroud and vacuum shut-in, see Section 5).

Method Cons:

- Requires longer equilibration time (48 hours is recommended) versus PRT method (2 hours recommended if project schedule allows, minimum wait time of 15 minutes); and
- IDW generated.

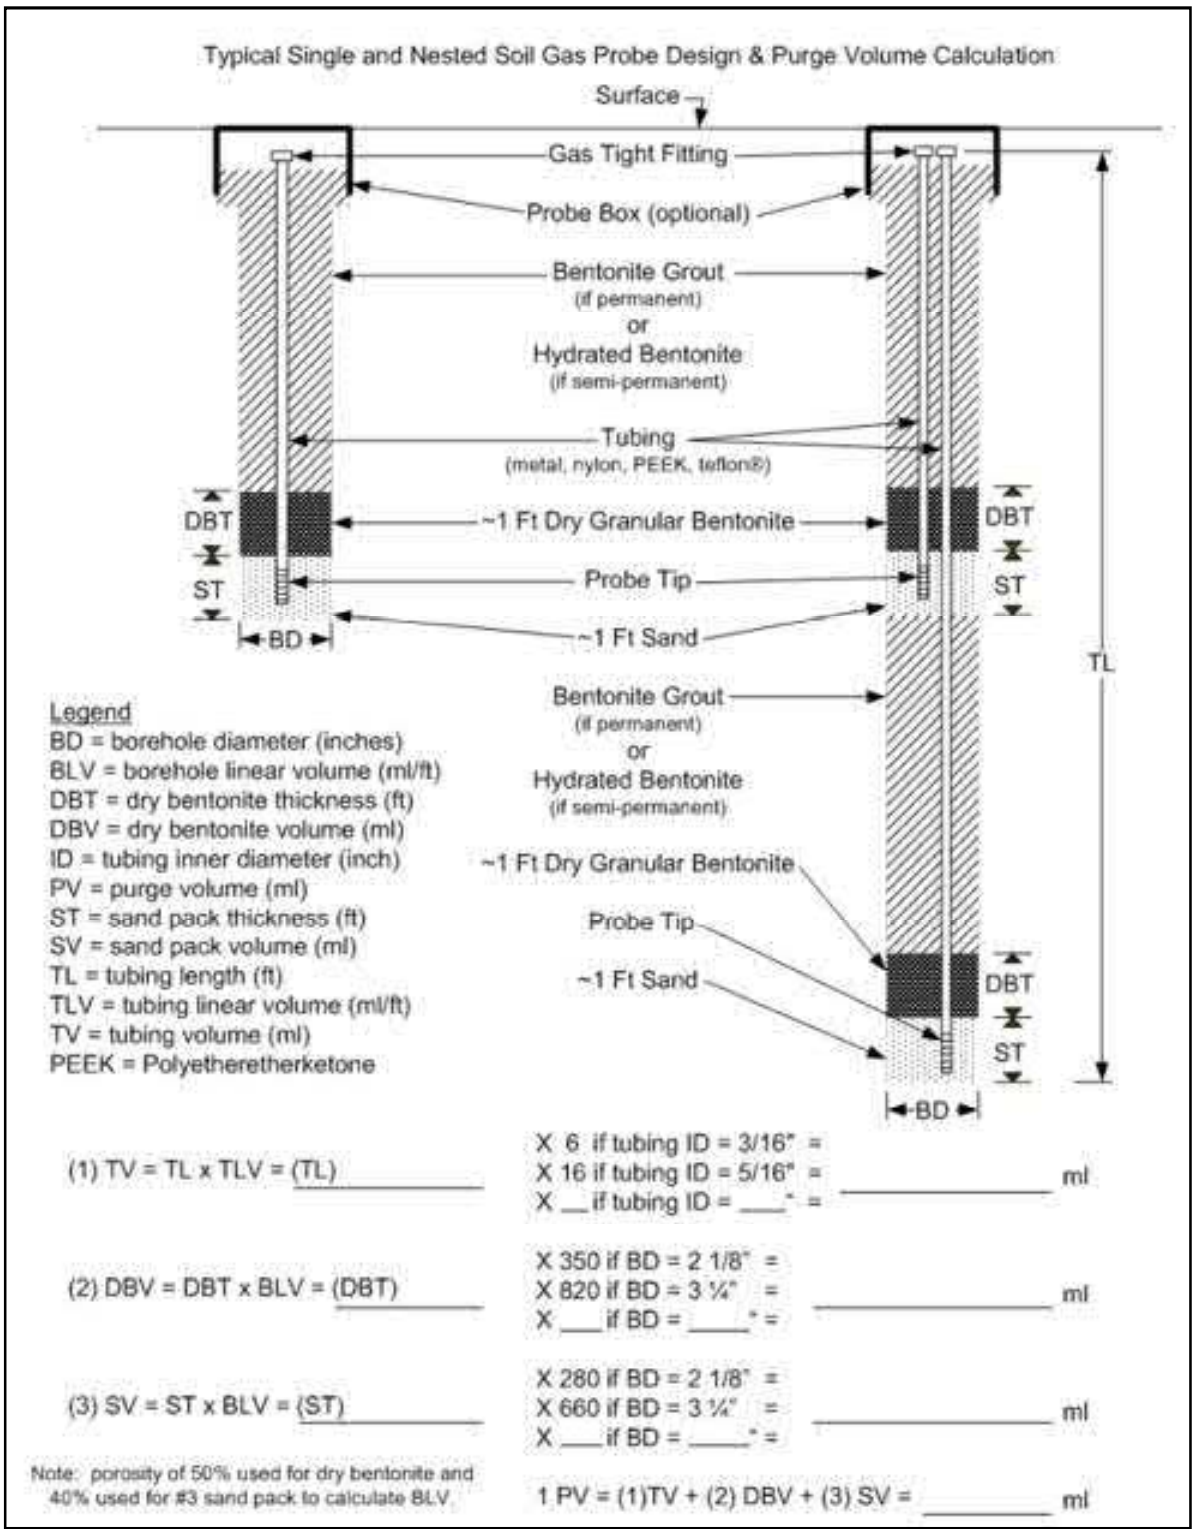

Figure 2: Typical Soil Gas Implant/Well Schematic (Source: Cal EPA, *Advisory - Active Soil Gas Investigations*, April 2012)

If the project schedule does not allow the recommended 48 hours for probe equilibration, an alternative approach is to develop the soil gas probe by purging a minimum of three dead volumes of the probe, including the sand pack and dry granular bentonite layer, and the associated sampling train (refer to Section 3.3 for details on purging and dead volumes).

3.2 Post-Run Tubing (PRT) Method

The PRT method allows for collection of soil gas samples from temporary sampling points installed using direct-push tooling while the tooling remains in the ground. Various subcontract and in-house drillers now have this tooling and are generally experienced with the PRT sampling method. A field equipment/materials checklist, list of procedures, and field data form for this process are included in Appendix B.

General installation procedures are as follows:

1) Install O-rings on the PRT expendable point holder and the PRT adapter;

2) Drive the PRT rod configuration into the ground, connecting probe rods as necessary to reach the desired depth. After desired depth has been achieved, disengage the expendable drive point;

3) Retract the rods approximately 4 to 6 inches up to create a void from which to sample the soil gas;

4) Insert the PRT adapter end of the tubing down the inside diameter of the probe rods. Feed the tubing down the rod bore until it hits bottom on the expendable point holder. Allow approximately 4 to 6 ft. of tubing to extend out of the top of the probe rods before cutting it;

5) Grasp the excess tubing end and apply some downward pressure while turning it in a counter-clockwise motion to engage the adapter threads with the expendable point holder. Continue turning until the PRT adapter O-ring bottoms out in the expendable point holder;

6) Pull up lightly on the tubing to test the engagement of the threads. Failure of the PRT adapter to thread could mean that intrusion of soil may have occurred during driving of the rods or disengagement of the expendable drive point;

7) Apply a hydrated bentonite or grout seal at the surface around the probe rod where it enters the ground;

8) Connect the end of the tubing to the sampling train and collect soil gas samples as outlined in Section 3.3 of this guidance; and

9) After sample collection, remove the direct-push drive rods and plug the borehole in accordance with applicable regulations.

It should be noted that select drillers have modified setups that allow attachment of the tubing to the terminal drive rod prior to advancement. This method is preferred if available in your area.

Method Pros:

- Relatively quick procedure, generally limited by time for actual sample collection;
- Less equilibration time required (2 hours recommended if project schedule allows, minimum wait time of 15 minutes) versus permanent soil gas implants (48 hours recommended);
- No return trips to site required for sampling or borehole plugging; and
- No soil IDW generated.

Method Cons:

- Not easily compatible with tracer-based leak detection (e.g., helium-filled shroud);
- Does not allow for return trips for re-sampling or multiple sampling events to evaluate temporal or seasonal variation;
- Does not allow for multiple sampling depths from same borehole;
- Engagement of tubing and associated PRT fitting down-hole inside the drive rods by twisting tubing to engage threads and O-rings is cumbersome, and proper evaluation of an air-tight O-ring seal is not possible; and
- Various method deficiencies are documented in the April 2012 California EPA Active Soil Gas Investigations Advisory, including incompatibility with leak testing and concerns over a proper air-tight seal of the PRT fitting.

Although the PRT method is widely-utilized in the industry, select jurisdictions (namely California) have concerns over its use. If your project includes leak detection testing or is a sensitive project requiring a high level of confidence and QA/QC, the installation of a permanent or semi-permanent soil gas sampling point with soil gas implants is recommended.

3.3 Sample Collection and Handling

The following section discusses the recommended soil gas sample collection procedures for both soil gas implants and PRT-method points. State-specific sampling requirements supersede this sampling guidance and should be utilized when applicable.

Step 1: Setting up the Sampling Train

Sampling trains can be setup in various ways but generally include the following items:

- Sample tubing (Teflon®, Teflon®-lined, PEEK, or Nylaflow® are recommended);
- Ball valves, fittings, and T-connectors;
- Purge pump (e.g., air sampling pump or peristaltic pump);
- PID to measure total VOCs; and
- Summa canister with dedicated low-flow (<200 ml/min) regulator.

The exact setup is up to the user, but it should utilize one or more of the recommended tubing options mentioned above and the tubing and fitting connections should be air-tight. The tubing and fittings utilized should also be dedicated and not re-used from one sample location to the other. If brass or machined fittings or valves are utilized, be aware that residual cutting oils from the manufacturing of these items may provide a source of cross contamination. If such fittings or valves are utilized, they should be properly decontaminated prior to use and a field/materials blank should be collected as discussed in Section 5.4 of this guidance.

T-connectors and ball valves are commonly utilized to allow access to the purge pump and/or PID meter during sample purging. These valves are then closed to isolate these instruments from the sampling train before opening the Summa canister and collecting the sample.

The use of polyethylene tubing commonly used for low-flow groundwater sample collection or vinyl tubing is discouraged because research shows this tubing can absorb and release COCs, leading to possible sample bias and/or cross-contamination.

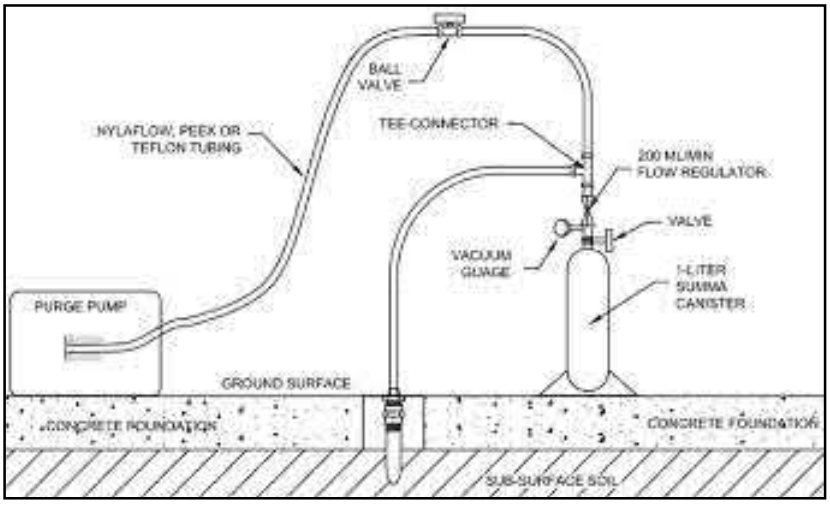

Figure 3: Example Sampling Train and Subslab Probe

Step 2: Sample Purging

Prior to sample collection, the soil gas sampling point and sampling train should be purged to remove "dead air" and ensure a representative soil gas sample is collected. This purging can be done with a standard air sampling pump, peristaltic pump, or PID meter. The purging should be conducted at a low-flow rate (<200 ml/min) and the vacuum applied should not exceed 100 inches of water. As a general rule of thumb, three sample train or system volumes (i.e., dead volumes) should be purged prior to sample collection. The dead volume equals the aggregate volume of all tubing, fittings, ports, and sanded and dry granular bentonite subsurface zones surrounding soil gas implants at a given location. If utilizing a PID to purge, check the flow rate of the model to ensure that it is <200ml/min or utilize a flow regulator to adjust to a low-flow rate.

For sensitive sites or where a higher degree of certainty is desired it is recommended to conduct a purge test (until vacuum, flow rate, and PID readings stabilize) on a representative sampling point in order to determine the optimal purge volume for the location. Purge tests should be conducted for each general soil type at the site. The resulting purge volume should then be applied consistently for all samples collected from the respective soil type in the study area. During the purge test, the vacuum and flow rate should be limited as noted above. This should limit the potential for ambient air being drawn into the sample from the ground surface and it should limit desorbing of vapors from contaminated soils.

Care should be taken to only purge the amount of soil gas necessary to appropriately remove the dead volume and obtain a representative sample when exterior shallow soil gas samples are being collected. Large purge volumes could result in atmospheric air being drawn into the vadose zone and diluting the soil gas sample.

Low permeability soils can pose challenges due to the restriction of adequate soil gas flow during purging and sample collection. Measures to aid in sample collection for low permeability soils can include reducing flow rates for sample collection, increasing sample collection times, and/or increasing the size of the sand pack surrounding the sampling tip. Refer to Appendix D of the California EPA *Advisory – Active Soil Gas Investigations*, dated April 2012, for alternative methods for low permeability soils.

Step 3: Sample Collection

After purging of three system/sampling train dead volumes or the optimal purge volume derived from the purge test, the valves leading to the pump and/or PID should be closed and the pump or PID turned off. After this, sample collection is simply initiated by opening the Summa canister already connected to the sampling train that is filled with representative soil gas. The Summa canister should be equipped with a laboratory-supplied, dedicated flow regulator set to a flow of <200 ml/min.

It is important that the canister vacuum is recorded: 1) immediately upon opening the canister and initiating sample collection; 2) at the end of sample collection prior to closing the canister; and 3) by the laboratory upon receipt of the sample at the laboratory and prior to sample analysis.

Sample collection is complete when the vacuum on the summa canister reaches near zero. It is preferred to leave some vacuum (e.g., 2 to 3 inches Hg or other as indicated by laboratory) in the Summa canister after sample collection so that a comparison with the vacuum measured prior to analysis at the laboratory can identify possible canister leaks during sample shipment. Then, the Summa canister valve should be closed prior to disassembling the sample train. If the site geology and/or time allowed for the investigation does not allow for complete filling of the Summa canister (i.e., vacuum reading near zero), contact the laboratory and report the observed vacuum reading prior to closing the Summa canister to see if they will have sufficient volume to reach the desired reporting limits to compare to applicable standards or screening values. If the reporting limits will not meet the needs of the project, consult the laboratory and APR for options on evaluating the resulting qualified data. Recording the sampling duration time is also useful in that it can be evaluated against the regulator flow rate to approximate the sample volume collected.

As previously mentioned, Summa canisters not exhibiting full vacuum when they are first opened should not be utilized since ambient air may have entered the canister during shipment. Differences in canister vacuum can also result from the shipping of canisters between locations with different elevations. If you have questions or concerns about the initial vacuum in your summa canister, contact the laboratory to discuss the vacuum that was recorded at the lab prior to canister shipment and to evaluate any discrepancies in vacuum.

The use of Tedlar® bags for soil gas sample collection is discouraged due to limited hold times and research showing the loss via breakthrough and/or absorption of COCs.

Step 4: Sample Packaging/Shipment

Soil gas samples are shipped back to the laboratory in closed Summa canisters in the originally-supplied box and packaging along with a properly-completed chain-of-custody. Soil gas samples should not be chilled or shipped in a cooler. Although sample collection in Tedlar® bags is discouraged by this guidance, if Tedlar® bags are utilized, they should be stored and shipped in a manner avoiding contact with direct sunlight.

Data Collection

There are various data that need to be recorded during soil gas sample collection. Refer to the field data forms in Appendices A through C for templates outlining the various data and parameters that should be collected in connection with the investigation methods discussed in this guidance.

A useful tool in the field during soil gas sample collection is a portable methane gas meter capable of measuring percent concentrations of methane, oxygen, and carbon dioxide. Readings of these parameters from a soil gas sampling point during purging can provide useful information regarding: 1) stabilization during a purge test; 2) subsurface oxygen concentrations and the potential for bioattenuation in the subsurface; and 3) whether methane is present in the subsurface at concentrations of potential concern (methane lower explosive limit equals 5% by volume).

4.0 SUBSLAB SOIL GAS SAMPLING PROTOCOL

Subslab soil gas data from samples collected under the building slab and within the advective envelope of the building-driven pressurization or depressurization indicates whether contaminants have accumulated directly under the building. This is the preferred method for soil gas evaluation for sites with existing buildings with foundations above the water table. Analytical detection limits should be low enough to effectively evaluate the indoor air risk using the industry-accepted, conservative default attenuation factor of 0.1 for subslab soil gas to indoor air (i.e., 10% of the subslab contaminant vapors assumed to enter the building via cracks or penetrations)

Subslab soil gas sampling may shorten the time needed to evaluate the vapor intrusion exposure pathway and may help reduce the overall cost of a vapor intrusion evaluation. When proceeding directly to subslab soil gas sampling, characterization of the subsurface soil gas around the building, determination of the physical character of the vadose zone, and site-specific vapor intrusion modeling may not be needed. However, the collection of subslab soil gas samples can be inconvenient to building occupants since it requires the removal of floor coverings and coring or drilling of the building slab.

Important items to note:

- During subslab soil gas sampling, be careful not to damage the integrity of the slab. Subslab utilities, post-tension cables, and other slab features such as radiant-heat systems should be located prior to selecting sampling locations. Blueprints and ground-penetrating radar (GPR) or x-ray studies can assist in locating these features.
- Since penetrating the slab creates a preferential pathway, proper sealing of the sampling port after sample collection is essential to avoid leaks.
- Subslab soil gas sampling should be avoided in areas where groundwater might intersect the slab.

The number, type (time-integrated or grab samples), and locations of subslab soil gas samples should be determined based on information collected during the building survey, an understanding of the building foundation, and the results from nearby soil gas sampling, if available. Sample locations should be selected taking source areas, maximum groundwater concentrations, areas with the highest likelihood of impact, and preferential pathways into account. Subslab samples collected near building edges can

show higher variability and may not represent the composition of soil gas under the interior of the slab. For this reason, it is recommended to locate subslab soil gas sampling locations away from building edges when possible and to have at least some of the samples collected from the center of the building footprint.

For foundations up to 5,000 square feet, at least three subslab soil gas samples should be collected taking into account the nearest source area and possible preferential migration pathways. The sampling frequency benchmark for buildings greater than 5,000 square feet in area is one subslab soil gas sample per additional 2,000 square feet of building area for building up to 15,000 square feet in area. If a lesser frequency of subslab soil gas samples for buildings less than 15,000 square feet is warranted based on client objectives, client budget, project objectives, or site access, contact one of the vapor intrusion contacts listed in Section 1.3 for assistance with determining the adequate number of samples and their optimal locations.

For foundations greater than 15,000 square feet, the adequate number of samples should be determined on a site-specific basis taking source areas, maximum groundwater concentrations, areas with the highest likelihood of impact, and preferential pathways into account.. Involve one of the vapor intrusion contacts listed in Section 1.3 for assistance with determining adequate sample numbers and locations.

4.1 Subslab Soil Gas Sampling Probe Installation

First, ensure that the appropriate subsurface utility locates have been conducted and that private on-site utilities within the building have been located. Also review building plans and correspond with property management to ensure that post-tension cables and other foundation features such as radiant-heat systems, if present, will not be damaged.

A field equipment/materials checklist, list of procedures, and field data form for this process are included in Appendix C.

4.1.1 Subslab Soil Gas Sampling Using Vapor Pin

Cox-Colvin & Associates, Inc.'s Vapor Pin™ technology (http://www.coxcolvin.com/VaporPin.php) are pre-assembled sub-slab probes offered in stainless-steel and brass (Figure 4), and include silicon sleeves that create a seal between the probe and the hole drilled in the concrete. They are easier to install and extract than conventional sub-slab probes and eliminate the need for grouting. Product details, installation procedures, and an installation video are located on the above-listed website. If Vapor Pins™ are utilized, leak detection using a tracer gas is recommended. Utilize the following protocol as a guide for subslab soil gas sampling installation using Vapor Pins™.

A copy of Cox-Colvin & Associates, Inc.'s Standard Operating Procedure for Installation and Extraction of the Vapor Pin is included in Appendix C.

Installation Procedure:

1) Check for buried obstacles (pipes, electrical lines, etc.) prior to proceeding.

2) Set up wet/dry vacuum to collect drill cuttings.

3) If a flush mount installation is required, drill a 1½-inch diameter hole at least 1¾-inches into the slab.

4) Drill a 5/8-inch diameter hole through the slab and approximately 1-inch into the underlying soil to form a void.

5) Remove the drill bit, brush the hole with the bottle brush, and remove the loose cuttings with the vacuum.

6) Place the lower end of Vapor Pin™ assembly into the drilled hole. Place the small hole located in the handle of the extraction/installation tool over the Vapor Pin™ to protect the barb fitting and cap, and tap the Vapor Pin™ into place using a dead blow hammer (Figure 5). Make sure the extraction/installation tool is aligned parallel to the Vapor Pin™ to avoid damaging the barb fitting.

   For flush mount installations (Figure 6), unscrew the threaded coupling from the installation/extraction handle and use the hole in the end of the tool to assist with the installation.

7) During installation, the silicone sleeve will form a slight bulge between the slab and the Vapor Pin™ shoulder. Place the protective cap on Vapor Pin™ to prevent vapor loss prior to sampling (Figure 7).

Figure 4: Assembled Vapor Pin™

Figure 5: Installing the Vapor Pin™

Figure 6: Flush-Mount Installation

Figure 7: Installed Vapor Pin™

8) For flush mount installations, cover the Vapor Pin™ with a flush mount cover.

9) Allow 20 minutes or more (consult applicable guidance for your situation) for the sub-slab soil-gas conditions to equilibrate prior to sampling.

10) Remove protective cap and connect sample tubing to the barb fitting of the Vapor Pin™ (Figure 8).

11) Conduct leak tests (e.g., real-time monitoring of oxygen levels on extracted sub-slab soil gas, placement of a water dam around the Vapor Pin™ (Figure 9), or tracer gas leak testing within a shroud). Consult your local guidance for appropriate tests.

12) Collect sub-slab soil gas sample. When finished sampling, replace the protective cap and flush mount cover until the next sampling event. If the sampling is complete, extract the Vapor Pin™.

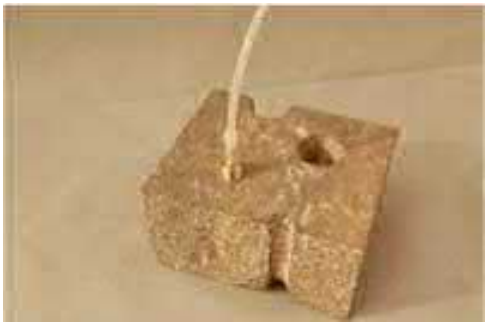

Figure 8: Vapor Pin™ Sample Connection

Figure 9: Water Dam Used for Leak Detection

Extraction Procedure:

1) Remove the protective cap, and thread the installation/extraction tool onto the barrel of the Vapor Pin™ (Figure 10). Continue turning the tool to assist in extraction, then pull the Vapor Pin™ from the hole (Figure 11).

2) Fill the void with hydraulic cement and smooth with the trowel or putty knife.

3) Prior to reuse, remove the silicone sleeve and discard. Decontaminate the Vapor Pin™ in a hot water and Alconox® wash, then heat in an oven to a temperature of 130° C.

Figure 10: Removing the Vapor Pin™

The Vapor Pin™ to designed be used repeatedly; however, replacement parts and supplies will be required periodically. These parts are available on-line at www.CoxColvin.com. If Vapor Pins™ are re-used, it is recommended that the silicon seals be replaced prior to re-use.

Figure 11: Extracted Vapor Pin™

4.1.2 Subslab Soil Gas Sampling Using Conventional Ports

Utilize the following protocol as a guide for subslab soil gas sampling port installation.

1) Drill a ⅜"-diameter pilot hole approximately 2 inches in depth.

2) Using the ⅜" pilot hole as your center, drill a 1"-diameter outer hole to a depth of approximately 1 ⅜". Vacuum any cuttings out of the hole.

3) Continue drilling the ⅜" inner or pilot hole through the slab and a few inches into the subslab material. While drilling, carefully vacuum out any cuttings from the outer hole.

4) Determine the length of stainless-steel tubing required to reach from the bottom of the outer hole, through the slab and into the open cavity below the slab. To avoid obstruction of the probe tube, ensure that it does not contact the subslab material. Using a tube cutter, cut the tubing to the desired length.

5) Attach a measured length (typically 3"-4") of ¼" OD stainless tubing to the female connector with a Swagelok® nut. Make sure that the tubing rests firmly in the fitting body and that the nut is finger tight. While holding the fitting body firmly, tighten the nut 1¼ turns.

6) Insert the ¼" hex socket plug into the female connector. If using a stainless steel socket plug, wrap one layer of Teflon® thread tape around the threads to prevent binding. If using a brass socket plug, no Teflon® tape is needed. Tighten the plug slightly. Do not over tighten. If excessive force is required to remove the plug during the sample set up phase, the probe may break loose from the anchoring cement.

7) Place the completed probe into the outer hole to check fit and to ensure that stainless steel tubing is not in contact with the subslab material. Make necessary adjustments to the hole or probe assembly.

8) In a disposable cup or other container, mix a small amount of the anchoring cement or grout. Add water sparingly to create a mixture that is fairly stiff and moldable. Place a spoonful or two of the cement/grout around the stainless steel tubing adjacent to the female connector nut. Mold the cement/grout into a mass around the connector nut and up around the main body of the probe assembly. Slide the Teflon® washer onto the stainless steel tube so that it rests next to the cement/grout mixture. The washer will prevent any anchoring cement/grout from flowing into the inner hole during the final step of probe installation.

9) Carefully place the probe assembly into the drilled hole, applying light pressure to seat the assembly. While inserting the probe assembly, work the concrete/grout mixture to fill voids. Clean up cement/grout that discharged out of the hole during placement; avoid getting any of the

concrete/grout into fittings or on fitting threads. Allow the cement/grout to cure according to manufacturer's instructions before sampling.

The bottom end of the stainless steel tubing should terminate within the slab (i.e., "float" within slab) and shall not extend into the subslab material. Refer to Figure 12 for a general schematic of a subslab soil gas sampling probe.

Ensure that a threaded, air-tight cap is placed on the soil gas sampling probe when purging/sampling is not being conducted to ensure that the probe is not serving as a preferential pathway for migration of vapors to indoor air.

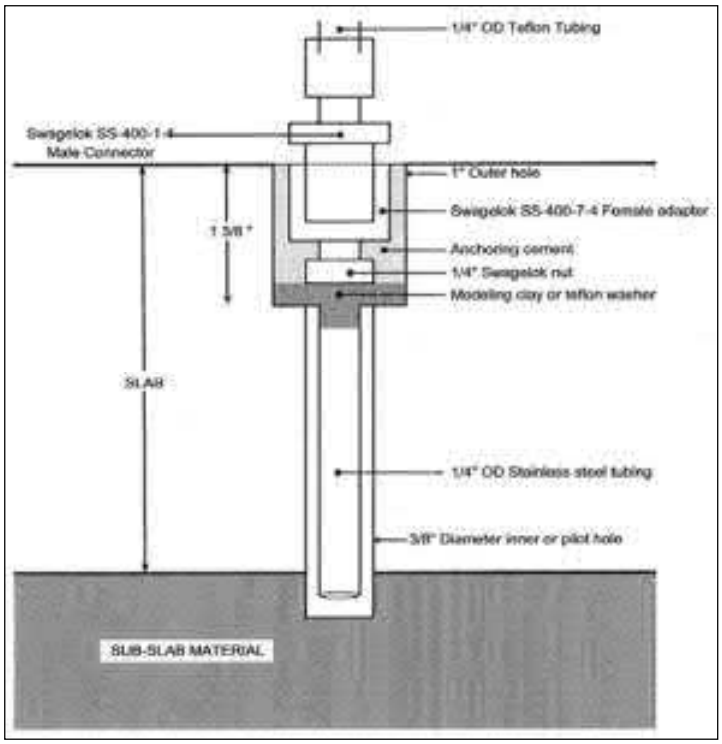

Figure 12: Subslab Sampling Probe (Source: Ohio EPA, *Sample Collection and Evaluation of Vapor Intusion to Indoor Air*, May 2010)

The probe materials may vary depending on the user, but generally consist of stainless-steel tubing and Swagelock ® couplers and fittings. Suggested materials lists are included in Appendix C. GC-grade stainless steel tubing and fittings are recommended for use on sensitive sites. If standard stainless steel or machined brass materials are utilized, ensure that they are properly decontaminated prior to sampling and collect a materials blank as outlined in Section 5.4 of this guidance.

4.2 Subslab Soil Gas Sample Collection

It is recommended that subslab soil gas probes be allowed to equilibrate for 24 hours prior to sample collection. If the project schedule does not allow a 24-hour equilibration time, the probes should be purged at a low-flow rate to promote collection of representative samples. If this approach is required, contact one of the vapor intrusion contacts in Section 1.3 to discuss the site-specific conditions and determine an adequate purge volume. For sites with elevated VOCs in the subslab, a PID can also be utilized during purging to evaluate equilibration for representative sample collection. Subslab soil gas sample collection procedures are the same as soil gas sample collection. Refer to Section 3.3 of this guidance.

In addition to soil gas sample collection, note that subslab sampling ports can also be utilized to obtain data on air pressures in the subslab for comparison to indoor air pressures to determine the pressure gradient across the slab. These probes can also be utilized to measure vacuum and flow rate beneath the slab during diagnostic testing conducted prior to the design of a mitigation system.

5.0 LEAK DETECTION AND QA/QC

The following section discusses leak-detection options for soil gas sampling. It is recommended that some form of leak detection be employed during Terracon soil gas investigations. The degree of leak detection will depend on the project objectives, jurisdiction where the sampling is conducted, and sensitivity of the project. The collection of field and materials blanks is also discussed in this section.

5.1 Tracer Testing of Sampling Probe

Tracer tests of the sampling probe are performed to document that the seal(s) between the surface and the soil gas sampling location or the sampling apparatus are not allowing ambient air into the sample. A variety of materials can be used as a tracer. Two of the most common are isopropyl alcohol and helium gas. Note that some states require the use of laboratory-grade helium, which can be difficult to acquire. Check with your regulatory agency to ensure the appropriate tracer gas is used.

A common apparatus for performing a gas tracer test consists of a 5-gallon bucket or similar plastic container placed over the probe-rod assembly or sample port to control wind drift and concentrate the tracer gas (refer to Figure 13). The tracer gas is then introduced into the bucket or container via a bottle of compressed gas resulting in a shroud concentration of approximately two orders of magnitude higher than the reporting limit of the field monitoring meter or analytical method used to analyze the sample.

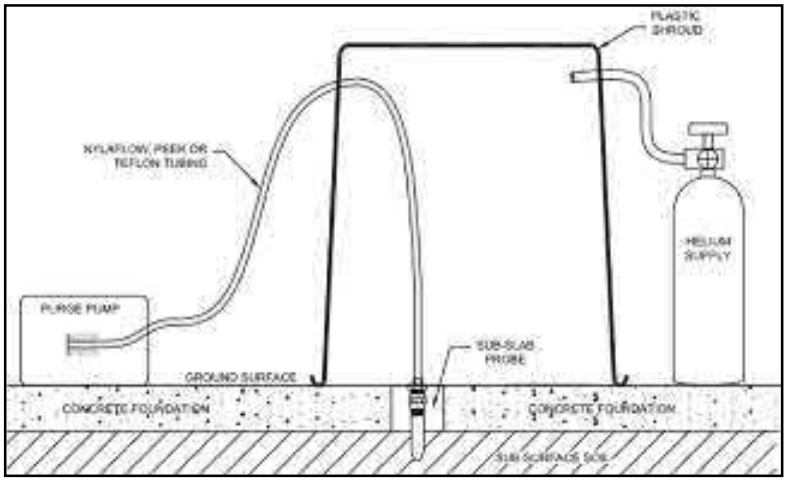

Figure 13: Simple Tracer Shroud

It is recommended that the tracer gas within the shroud be kept within ± 10% of its target value. The tracer gas concentration is measured both in the shroud and in the soil gas removed during sampling train purging using a field monitoring meter. The field monitoring meter or analytical method (if

samples are submitted for laboratory analysis) should be capable of measuring the tracer compound in air to an accuracy of 0.1 percent. For helium tracer gas, the MGD-2002 leak detector or equivalent is recommended.

The concentration of tracer gas measured from the sampling train should read less than 5% of the minimum shroud concentration. If the tracer gas measurement is greater than 5% of the minimum shroud concentration, the sample train should be inspected for leaks and re-tested.

In addition to measuring tracer gas using a field monitor, the tracer gas concentration in the collected air samples can be analyzed by the lab to see if elevated levels of tracer gas entered the samples. Some jurisdictions may require analytical testing of tracer gas; refer to your state-specific guidance. It should be noted that this simple tracer gas method for the sampling probe does not account for potential leaks associated with tubing and connections of the sampling train.

5.2 Tracer Testing of Sampling Probe and Sampling Train

One option for tracer testing for leak detection is the use a shroud covering both the soil gas sampling probe and the entire sampling train (i.e., Summa canister, associated gauges and regulators, tubing connections, and valves). An example setup is shown in Figure 14. This method is the most-complete tracer testing method in that all potential sources of leaks in the sampling train and the sampling probe are accounted for. The most common tracer gas is helium based on its availability and ease of monitoring in the field with readily-available field monitors.

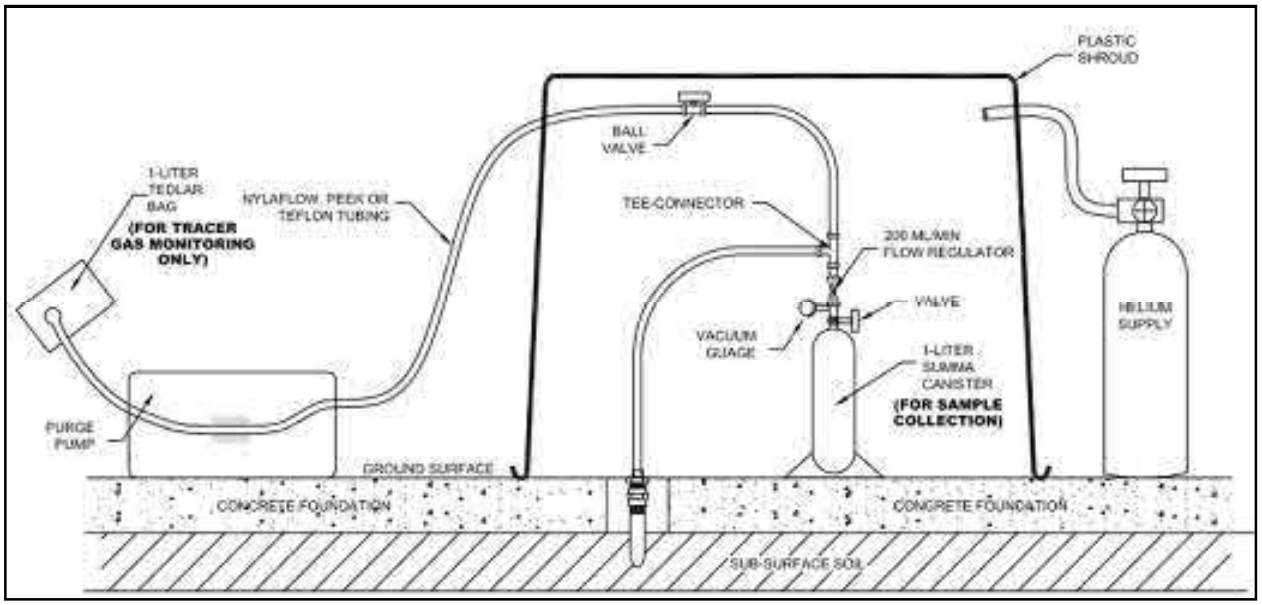

Figure 14: Tracer Shroud for Sampling Train and Probe

Tracer gas is introduced into the shroud (clear plastic container works best so the sampling train can be viewed) and maintained at a concentration of ± 10% of its target value (refer to Section 5.1). The sampling train and probe are then purged using a peristaltic pump or other pump and the tracer gas concentration of the purged soil gas is monitored using the field monitoring meter. The monitoring consists of filling a 1-L Tedlar® bag with the purged soil gas and measuring for tracer gas using the field monitor. This process is repeated two additional times to yield three consecutive tests (3 liters total purge volume) for tracer gas.

If the detected tracer gas concentration in the purged soil gas is 5% or less of the minimum tracer gas concentration in the shroud during three consecutive tests, sampling may proceed. If tracer gas is detected in the purged soil gas at concentrations greater than 5% of the minimum tracer gas concentration detected in the shroud, the probe and sampling train should be examined for potential leaks and the tracer test re-conducted.

5.3 Vacuum Shut-In Testing

Shut-in testing is a simple technique used in the field to evaluate the integrity of the sample train. A typical shut-in test involves closing the valve to the vapor probe and evacuating the sample train (all associated tubing hooked up to the Summa canister) to a measured vacuum. The vacuum should be a minimum of approximately 100 inches of water. Then, the vacuum is shut in by closing the valve at the opposite end of the sampling train near the pump pulling the vacuum. This vacuum is monitored using an in-line vacuum gauge. The initial measured vacuum should be maintained for 30 seconds for a positive shut-in test. If the vacuum dissipates from the sample train, the shut-in test has failed, and all connections should be inspected for leaks prior to proceeding with sampling. It should be noted that the major limitation of the vacuum shut-in test is that it does not allow leak testing of the soil gas probe.

5.4 Field and Materials Blanks

A field blank can provide information on possible cross-contamination from ambient air, while a materials blank can provide information on possible cross contamination from the tubing and fittings stock used for probe construction and in the sampling train. Collection of both types of blanks is recommended on soil gas investigations for QA/QC purposes.

Field Blank

The field blank should be collected by placing a Summa canister and dedicated flow regulator in a location on the site consistent with the soil gas sampling probes. The sample should be collected at some time during soil gas sample collection, preferably at a time of day when background sources of VOCs in ambient air (e.g., vehicle exhaust, industrial emissions, etc.) are expected to be the highest. Collect the sample by opening the Summa canister (similar procedures as discussed in Section 3.3).

When collecting a field blank for interior sub-slab samples, be aware that the most-representative ambient air blank is actually indoor air and the reported data would potentially need to be addressed as appropriate. If indoor air sampling has not been authorized by the client, an indoor ambient field blank should not be collected in conjunction with sub-slab soil gas sampling.

Materials Blank

The materials blank is collected by connecting a canister of commercially-available, certified-zero air calibration gas (such as that used for zero calibration of PID instruments) to the Summa canister via the same probe and sampling train materials utilized for the soil gas probes. The zero air is then drawn through the sampling train during collection into the Summa canister. Collection of a materials blank is particularly important if using brass or other machined tubing or fittings that may lead to cross contamination from residual cutting oils and cleaning agents.

APPENDIX A

Soil Gas Implant Method: Equipment/Materials List, Procedures, and Field Data Form

Soil Gas Implant – Suggested Equipment

The below is a list of suggested equipment for soil gas implants/wells. Various alternatives exist for the screened sampling tips that are employed in the subsurface to collect soil gas. All sampling train components (e.g., sampling tips, tubing, valves, fittings, etc.) should be dedicated or properly decontaminated between sampling locations.

Soil Gas Implant Installation

- Level D or Applicable PPE
- Stainless-Steel Hand Auger (if not using drilling rig)
- Standard Decontamination Equipment
- Soil Gas Implants/Screened Sampling Tips (some options below)
    - EON Products, Inc. Soil Gas Vapor Point with Umbrella (Cat. Number SVP-200)
    - EON Soil Gas Vapor Screen (Cat. Number SVP-201)
    - Environmental Service Products (ESP) SKU# SVPT91
    - Environmental Service Products (ESP) SKU# SVPT92
- Tubing (1/4" OD): Teflon®, Teflon®-Lined, Nylaflow, or PEEK
- Plastic or Stainless-Steel Valve to Close Off Tubing at Surface Completion
- Washed and Cleaned Fine-Grained Sand
- Dry Coarse or Granular Bentonite
- Bentonite Grout (5% Bentonite / 95% Portland Cement)
- Well Vault or Cover for Surface Completion
- Portland Cement

Sampling Train and Sampling Equipment

- Sample Tubing (1/4" OD): Teflon®, Teflon®-Lined, Nylaflow, or PEEK
- Connection/Utility Tubing (3/8" OD): Silicone
- Fittings/Valves: Stainless-Steel and/or Plastic; Ball Valves, 3-Way Valves, Tee Connectors, and/or Couplers (will vary based on user preference and compatibility with laboratory-supplied flow regulators and sampling trains)
- Summa Canister Equipped with Low-Flow Regulator (i.e., <200ml/min)
- Purge Pump: Peristaltic Pump, Lung Box, or Indoor Air Sampling Pump
- Graduated Syringe (alternative to pump for purging)
- Vacuum Gauge (if conducting vacuum shut-in test on sampling train)
- Tedlar® Bags (to monitor soil gas with PID, etc. – not for sample collection)
- Photoionization Detector (PID) Equipped with Appropriate Lamp
- Landfill Gas or Multi-Gas Meter (CH_4, CO_2, O_2, Balance Gas)

Soil Gas Implant Procedures

1. Use a hand auger, geoprobe, or hollow stem auger to advance a soil boring to the desired depth. Photoionization detector (PID) readings may be collected to assist in determining the sampling interval(s).

2. Determine the length of tubing (Teflon®-lined, PEEK, or Nylaflow tubing recommended) required to reach from the bottom of the borehole. Connect a soil gas sampling screen to the bottom of the tubing, cut the tubing to the desired length, and insert the screen to a depth of approximately 6-inches above the bottom of the borehole.

3. Fill the boring with 20/40 grade silica sand to a minimum of 6 inches above and below the sampling screen elevation.

4. Place at least 6 inches of dry, granular bentonite above the sand pack to prevent hydrated bentonite from infiltrating the sand pack.

5. Seal the remainder of the boring with hydrated bentonite or bentonite grout. Surface completion may be constructed if a permanent well point is being installed.

6. Allow the soil gas implant/well to equilibrate for a minimum of 48 hours prior to purging or sampling.

7. Attach the sample tubing to the associated valves and sample container (i.e., Summa canister) to construct the sampling train. The exact sampling train setup may vary depending on user preferences but typically involves the use of a three-way valve or a tee-connector and valves to allow the user to switch flow between tubing leading to the purge pump and tubing leading to the Summa canister while not allowing ambient air to backflow into the system. Refer to Step 1 in Section 3.3 of guidance document and Figure 5 of guidance document.

8. Open the valve to the vacuum pump and purge a minimum three system volumes (i.e., pore space of the sand pack and dry granular bentonite, and the volume of all tubing and fittings within the sampling train). Conduct leak detection during purging as applicable (Refer to Section 5 of guidance document).

9. After purging, turn the three-way valve or associated valves to close off the purge tubing from the sampling train while allowing the sample tubing to remain connected to the Summa canister and filled with representative soil gas.

10. Collect soil gas samples as outlined in Section 3.3 of the guidance document.

11. After sample collection, plug and abandon semi-permanent soil gas implants/wells in accordance with applicable regulations.

Post-Run Tubing Method: Equipment/Materials List, Procedures, and Field Data Form

Post-Run Tubing (PRT) – Suggested Equipment

The below is a list of suggested equipment for soil gas sampling using post-run tubing methods. If using a drilling subcontractor to collect PRT soil gas samples, ensure that the driller is experienced with the equipment and methods. All sampling train components (e.g., tubing, valves, fittings, etc.) should be dedicated or properly decontaminated between sampling locations. Hydrate bentonite or bentonite grout should be applied as seal around the probe rods at ground surface.

PRT Installation

- Level D or Applicable PPE
- Standard Decontamination Equipment
- Geoprobe Equipment Options
    - 1.25-inch Diameter Probe Rod
        - 60-inch length (5-foot) — Cat. # AT1260
        - 48-inch length (4-foot) — Cat. # AT1248
        - 36-inch length (3-foot) — Cat. # AT1236
        - 24-inch length (2-foot) — Cat. # AT1224
        - 12-inch length (1-foot) — Cat. # AT1212
        - 6-inch length (1/2-foot) — Cat. # AT1206
    - Geoprobe Post-Run Tubing System (PRT) Adaptor
        - PRT adaptor for ¼-inch ID tubing — Cat. # PR-25S
        - O-Rings for PRT adaptor — Cat. # PR25R
    - Geoprobe 1.25-inch PRT Expendable Point Holder — Cat. # PR1215
    - Geoprobe 1.0-inch Expendable Point
        - Steel point with O-ring — Cat. # AT14K
        - Steel point without O-ring — Cat. # AT14
    - Geoprobe Manual Slide Hammers
        - 30 Pound hammer — Cat. # 16151
        - 45 Pound hammer — Cat. # 16153
    - Geoprobe Manual Slide Hammer Anvil for 1.25-inch Rods — Cat. # 16175
    - Geoprobe Manual Probe Rod Jack ASM 1.25-inch Rods — Cat. # AT9925
    - Geoprobe Extension Rods to Knock Out Expendable Point
        - 60-Inch Stainless Steel Extension Rods — Cat. # 10073
        - Extension Rod Quick Link Box — Cat. # AT69
- Tubing (1/4" OD): Teflon®, Teflon®-Lined, Nylaflow, or PEEK
- Hydrated Bentonite or Bentonite Grout (5% Bentonite / 95% Portland Cement)

Sampling Train and Sampling Equipment

- Sample Tubing (1/4" OD): Teflon®, Teflon®-Lined, Nylaflow, or PEEK
- Connection/Utility Tubing (3/8" OD): Silicone
- Fittings/Valves: Stainless-Steel and/or Plastic; Ball Valves, 3-Way Valves, Tee Connectors, and/or Couplers (will vary based on user preference and compatibility with laboratory-supplied flow regulators and sampling trains)
- Summa Canister Equipped with Low-Flow Regulator (i.e., <200ml/min)
- Purge Pump: Peristaltic Pump, Lung Box, or Indoor Air Sampling Pump
- Graduated Syringe (alternative to pump for purging)
- Vacuum Gauge (if conducting vacuum shut-in test on sampling train)
- Tedlar® Bags (to monitor soil gas with PID, etc. – not for sample collection)
- Photoionization Detector (PID) Equipped with Appropriate Lamp
- Landfill Gas or Multi-Gas Meter (CH_4, CO_2, O_2, Balance Gas)

Post-Run Tubing (PRT) Procedures

1. Install O-rings on the PRT expendable point holder and the PRT adapter.
2. Drive the PRT rod configuration into the ground, connecting probe rods as necessary to reach the desired depth. After desired depth has been achieved, disengage the expendable drive point.
3. Retract the rods approximately 4 to 6 inches up to create a void from which to sample the soil gas.
4. Insert the PRT adapter end of the tubing down the inside diameter of the probe rods. Feed the tubing down the rod until it hits bottom on the expendable point holder. Allow approximately 4 to 6 ft. of tubing to extend out of the top of the probe rods before cutting it.
5. Grasp the excess tubing end and apply some downward pressure while turning it in a counter-clockwise motion to engage the adapter threads with the expendable point holder. Continue turning until the PRT adapter O-ring bottoms out in the expendable point holder.
6. Pull up lightly on the tubing to test the engagement of the threads. Failure of the PRT adapter to thread could mean that intrusion of soil may have occurred during driving of the rods or disengagement of the expendable drive point.
7. Apply a hydrated bentonite or grout seal at the surface around the probe rod where it enters the ground.
8. Allow the probe to equilibrate for a minimum of 2 hours.
9. Attach the sample tubing to the associated valves and sample container (i.e., Summa canister) to construct the sampling train. The exact sampling train setup may vary depending on user preferences but typically involves the use of a three-way valve or a tee-connector and valves to allow the user to switch flow between tubing leading to the purge pump and tubing leading to the Summa canister while not allowing ambient air to backflow into the system. Refer to Step 1 in Section 3.3 of guidance document and Figure 5 of guidance document.
10. Open the valve to the vacuum pump and purge a minimum three system volumes (i.e., void or pull-back space beneath the terminal geoprobe rod, and the volume of all tubing and fittings within the sample train). Conduct leak detection during purging as applicable (Refer to Section 5 of guidance document).
11. After purging, turn the three-way valve or associated valves to close off the purge tubing from the sampling train while allowing the sample tubing to remain connected to the Summa canister and filled with representative soil gas.
12. Collect soil gas samples as outlined in Section 3.3 of the guidance document.
13. After sample collection, remove the direct-push drive rods and plug the borehole in accordance with applicable regulations.

APPENDIX C

Subslab Soil Gas: Equipment/Materials List, Procedures, and Field Data Form

Sub-Slab Soil Gas – Suggested Equipment

The below is a list of suggested equipment for sub-slab port installation. Various alternatives exist for fittings and couplers that can be used to construct the ports. Stainless-steel tubing and fittings are recommended since brass components may lead to cross-contamination from cutting fluids. If using brass components, make sure they are properly decontaminated. All sampling train components (e.g., tubing, valves, fittings, etc.) should be dedicated or properly decontaminated between sampling locations.

Sub-Slab Port Construction

- Level D PPE
- Rotary Hammer Drill
- 1" or 1 ½" Diameter Carbide Masonry Drill Bit
- 3/4" or 3/8" Diameter Carbide Masonry Drill Bit
- Wet/Dry Vacuum Equipped with HEPA Filtration Unit
- Spray Bottle with Deionized or Distilled Water
- Dead-Blow Hammer
- 1/4" Outer-Diameter Stainless Steel Tubing
- 1/4" Swagelok® Nut
- Swagelok® SS-400-7-4 Female Adapter
- Swagelok® SS-400-1-4 Male Connector
- Teflon Washer or Modeling Clay
- Portland Cement

Sampling Train and Sampling Equipment

- Sample Tubing (1/4" OD): Teflon®, Teflon®-Lined, Nylaflow, or PEEK
- Connection/Utility Tubing (3/8" OD): Silicone
- Fittings/Valves: Stainless-Steel and/or Plastic; Ball Valves, 3-Way Valves, Tee Connectors, and/or Couplers (will vary based on user preference and compatibility with laboratory-supplied flow regulators and sampling trains)
- Summa Canister Equipped with Low-Flow Regulator (i.e., <200ml/min)
- Purge Pump: Peristaltic Pump, Lung Box, or Indoor Air Sampling Pump
- Graduated Syringe (alternative to pump for purging)
- Vacuum Gauge (if conducting vacuum shut-in test on sampling train)
- Tedlar® Bags (to monitor soil gas with PID, etc. – not for sample collection)
- Photoionization Detector (PID) Equipped with Appropriate Lamp
- Landfill Gas or Multi-Gas Meter (CH_4, CO_2, O_2, Balance Gas)

Subslab Soil Gas Procedures

1. Clear the locations all on-site utilities that may be located beneath or within the slab. Additionally, clear the locations of all post-tension cables and other foundation features such as radiant-heat flooring.
2. Drill a ⅜"-diameter pilot hole approximately 2 inches in depth.
3. Using the ⅜" pilot hole as your center, drill a 1"-diameter outer hole to a depth of approximately 1 ⅜". Vacuum any cuttings out of the hole.
4. Continue drilling the ⅜" inner or pilot hole through the slab and a few inches into the subslab material. While drilling, carefully vacuum out any cuttings from the outer hole.
5. Determine the length of stainless-steel tubing required to reach from the bottom of the outer hole, through the slab and into the open cavity below the slab. To avoid obstruction of the probe tube, ensure that it does not contact the subslab material. Using a tube cutter, cut the tubing to the desired length.
6. Attach a measured length (typically 3"-4") of ¼" OD stainless tubing to the female connector with a Swagelok® nut. Make sure that the tubing rests firmly in the fitting body and that the nut is finger-tight. While holding the fitting body firmly, tighten the nut 1¼ turns.
7. Insert the ¼" hex socket plug into the female connector. If using a stainless steel socket plug, wrap one layer of Teflon® thread tape around the threads to prevent binding. If using a brass socket plug, no Teflon® tape is needed. Tighten the plug slightly. Do not over tighten. If excessive force is required to remove the plug during the sample set up phase, the probe may break loose from the anchoring cement.
8. Place the completed probe into the outer hole to check fit and to ensure that stainless steel tubing is not in contact with the subslab material. Make necessary adjustments to the hole or probe assembly.
9. In a disposable cup or other container, mix a small amount of the anchoring cement or grout. Add water sparingly to create a mixture that is fairly stiff and moldable. Place a spoonful or two of the cement/grout around the stainless steel tubing adjacent to the female connector nut. Mold the cement/grout into a mass around the connector nut and up around the main body of the probe assembly. Slide the Teflon washer onto the stainless steel tube so that it rests next to the cement/grout mixture. The washer will prevent any anchoring cement/grout from flowing into the inner hole during the final step of probe installation.
10. Carefully place the probe assembly into the drilled hole, applying light pressure to seat the assembly. While inserting the probe assembly, work the concrete/grout mixture to fill voids. Clean up cement/grout that discharged out of the hole during placement; avoid getting any of the concrete/grout into fittings or on fitting threads. Allow the cement/grout to cure according to manufacturer's instructions before sampling.

11. Allow the subslab soil gas probe to equilibrate for a minimum of 24 hours prior to purging or sampling. If project schedule does not allow for this equilibration period, contact a member of the Vapor Encroachment/Intrusion Committee for purging alternatives to reduce the equilibration period.
12. Attach sample tubing to the subslab probe and the associated valves and sample container (i.e., Summa canister) to construct the sampling train. The exact sampling train setup may vary depending on user preferences but typically involves the use of a three-way valve or a tee-connector and valves to allow the user to switch flow between tubing leading to the purge pump and tubing leading to the Summa canister while not allowing ambient air to backflow into the system. Refer to Step 1 in Section 3.3 of guidance document and Figure 5 of guidance document.
13. Open the valve to the vacuum pump and purge a minimum three system volumes (i.e., the volume of all tubing and fittings within the sampling train). Conduct leak detection during purging as applicable (Refer to Section 5 of guidance document).
14. After purging, turn the three-way valve or associated valves to close off the purge tubing from the sampling train while allowing the sample tubing to remain connected to the Summa canister and filled with representative soil gas.
15. Collect soil gas samples as outlined in Section 3.3 of the guidance document.
16. After sample collection, remove the subslab probes and patch to match existing grade.

Standard Operating Procedure Installation and Extraction of the Vapor Pin™

May 20, 2011

Scope:

This standard operating procedure describes the installation and extraction of the Vapor Pin™[1] for use in sub-slab soil-gas sampling.

Purpose:

The purpose of this procedure is to assure good quality control in field operations and uniformity between field personnel in the use of the Vapor Pin™ for the collection of sub-slab soil-gas samples.

Equipment Needed:

- Assembled Vapor Pin™ [Vapor Pin™ and silicone sleeve (Figure 1)];
- Hammer drill;
- 5/8-inch diameter hammer bit (Hilti™ TE-YX 5/8" x 22" #00206514 or equivalent);
- 1½-inch diameter hammer bit (Hilti™ TE-YX 1½" x 23" #00293032 or equivalent) for flush mount applications;
- ¾-inch diameter bottle brush;
- Wet/dry vacuum with HEPA filter (optional);
- Vapor Pin™ installation/extraction tool;
- Dead blow hammer;
- Vapor Pin™ flush mount cover, as necessary;
- Vapor Pin™ protective cap; and
- VOC-free hole patching material (hydraulic cement) and putty knife or trowel.

[1]Cox-Colvin & Associates, Inc., designed and developed the Vapor Pin™; a patent is pending.

Figure 1. Assembled Vapor Pin™.

Installation Procedure:

1) Check for buried obstacles (pipes, electrical lines, etc.) prior to proceeding.

2) Set up wet/dry vacuum to collect drill cuttings.

3) If a flush mount installation is required, drill a 1½-inch diameter hole at least 1¾-inches into the slab.

4) Drill a 5/8-inch diameter hole through the slab and approximately 1-inch into the underlying soil to form a void.

5) Remove the drill bit, brush the hole with the bottle brush, and remove the loose cuttings with the vacuum.

6) Place the lower end of Vapor Pin™ assembly into the drilled hole. Place the small hole located in the handle of the extraction/installation tool over the Vapor Pin™ to protect the barb fitting and cap, and tap the Vapor Pin™ into place using a

dead blow hammer (Figure 2). Make sure the extraction/installation tool is aligned parallel to the Vapor Pin™ to avoid damaging the barb fitting.

Figure 2. Installing the Vapor Pin™.

For flush mount installations, unscrew the threaded coupling from the installation/extraction handle and use the hole in the end of the tool to assist with the installation (Figure 3).

Figure 3. Flush-mount installation.

During installation, the silicone sleeve will form a slight bulge between the slab and the Vapor Pin™ shoulder. Place the protective cap on Vapor Pin™ to prevent vapor loss prior to sampling (Figure 4).

Figure 4. Installed Vapor Pin™.

7) For flush mount installations, cover the Vapor Pin™ with a flush mount cover.

8) Allow 20 minutes or more (consult applicable guidance for your situation) for the sub-slab soil-gas conditions to equilibrate prior to sampling.

9) Remove protective cap and connect sample tubing to the barb fitting of the Vapor Pin™ (Figure 5).

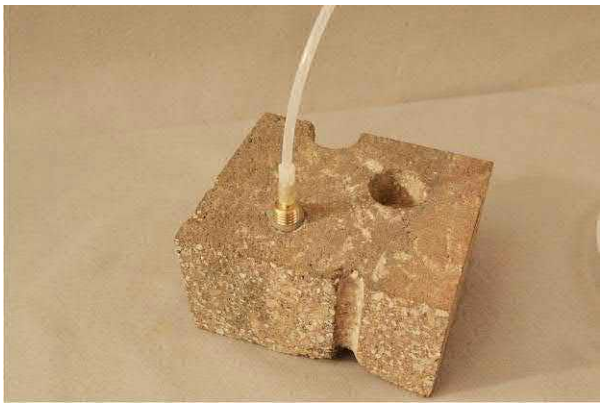

Figure 5. Vapor Pin™ sample connection.

10) Conduct leak tests [(e.g., real-time monitoring of oxygen levels on extracted sub-slab soil gas, or placement of a water

dam around the Vapor Pin™) Figure 6]. Consult your local guidance for possible tests.

Figure 6. Water dam used for leak detection.

11) Collect sub-slab soil gas sample. When finished sampling, replace the protective cap and flush mount cover until the next sampling event. If the sampling is complete, extract the Vapor Pin™.

Extraction Procedure:

1) Remove the protective cap, and thread the installation/extraction tool onto the barrel of the Vapor Pin™ (Figure 7). Continue turning the tool to assist in extraction, then pull the Vapor Pin™ from the hole (Figure 8).

Figure 7. Removing the Vapor Pin™.

Figure 8. Extracted Vapor Pin™.

2) Fill the void with hydraulic cement and smooth with the trowel or putty knife.

3) Prior to reuse, remove the silicone sleeve and discard. Decontaminate the Vapor Pin™ in a hot water and Alconox® wash, then heat in an oven to a temperature of 130° C.

The Vapor Pin™ to designed be used repeatedly; however, replacement parts and supplies will be required periodically. These parts are available on-line at www.CoxColvin.com.

Replacement Parts:

Vapor Pin™ Kit Case - VPC001
Vapor Pins™ - VPIN0522
Silicone Sleeves - VPTS077
Installation/Extraction Tool - VPIE023
Protective Caps - VPPC010
Flush Mount Covers - VPFM050
Water Dam - VPWD004
Brush - VPB026

APPENDIX D

Available Soil Gas Analytical Methods

AVAILABLE SOIL GAS ANALYTICAL METHODS AND TYPICAL COSTS[1]		
Parameter	Method	Typical Cost[2]
BTEX, MTBE, TPH	EPA TO-3	$75
VOCs (1 - 20 compounds), 5 - 20 ppb	EPA TO-15	$90
VOCs (1 - 20 compounds), 0.5 - 2 ppb	EPA TO-15	$110
Polar and nonpolar VOCs	EPA TO-15	$125
Low-level VOCs	EPA TO-15 SIM	$165
PCBs/Pesticides	EPA TO-4A or TO-10A	$175
SVOCs	EPA TO-13A	$190
Dioxins/Furans	EPA TO-9A	$675
Fixed gases (methane, nitrogen, oxygen)	ASTM D1946	$115
Fixed gases (CO2 only)	ASTM D1946	$100

NOTES:

[1]Common available analytical methods are listed in the table above. The list is not all-inclusive. Modified EPA SW-846 Methods 8021 and 8260 can be utilized to analyze soil gas. If using modified SW-846 Methods, ensure that the detection limits will be low enough to compare your data to the applicable regulatory criteria. Also ensure that your state or jurisdiction accepts the use of modified SW-846 Methods.

[2]Typical costs based on 2013 industry averages.

HEXAVALENT CHROMIUM (CR6)

Aqueous Sampling Instructions - Methods 218/7199/3500

This sampling device extends the holding time from 24 hours to 28 days.
Samples are field filtered and preserved.

Directions:

1. Fill 50ml plastic vial with sample.
2. Put filter on top of vial and attach plunger to top.
3. Slowly push plunger into sample vial to filter the water.
4. Push until filter stops or to the 20ml line on vial.
5. Add preservative to sample and cap.
6. Return in cooler preserved on ice.

Single use only - Do Not Re-use.

A4 Project/Task Organization

This Community-wide Quality Assurance Project Plan (QAPP) provides guidelines for the acquisition, analysis, and validation of data collected as part of the Salt Lake County Brownfields Assessments. Following is a brief description and identification of key personnel involved in conducting Phase II Environmental Site Assessments (ESAs) as part of the Salt Lake County Brownfields Assessment Grant project. An organizational chart indicating the roles of these individuals is included as **Figure 1**.

Salt Lake County Project Manager

The Salt Lake County Project Manager is the central point of contact for directing Salt Lake County Brownfields Assessment Grant activities and problem resolution, and is the primary point of contact with the Consultant Project Manager regarding administrative and technical issues associated with this project. The Salt Lake County Project Manager for this project is:

Ruedigar Matthes
Economic Development Research Coordinator
Salt Lake County Department of Transportation, Housing, and Economic Development
2001 South State Street S2 100
Salt Lake City, UT 84114
(385) 468-4868
Email: RMatthes@slco.org

Consultant Project Manager

The Consultant Project Manager will have responsibility for overseeing the activities associated with the Phase II ESAs. This person will be responsible for the preparation and maintenance of the QAPP, for distribution of the most current version of the QAPP to the individuals identified in A3, preparing and/or overseeing preparation of Sampling and Analysis Plans (SAPs) for individual sites, and for overall management of the field investigation portion of the project. The Consultant Project Manager will coordinate closely with the Consultant Quality Assurance/Quality Control (QA/QC) Officer and provide oversight during the field activities with routine visits to the jobsite(s). The Consultant Project Manager will be the primary technical point of contact for communication with Salt Lake County. Additional responsibilities include scheduling, subcontractor procurement, cost accounting and reporting, identification of potential

problems and development of contingency plans to respond to the identified problems. The Consultant Project Manager for this project is:

Mr. Andy King, P.G.
Terracon Consultants, Inc.
6949 South High Tech Drive
Midvale, UT 84047
Phone: (801) 746-5443
Email: andy.king@terracon.com

Consultant QA/QC Officer

The Consultant QA/QC Officer for this project will act as an independent advisor to the Consultant Project Manager and will oversee project activities as necessary. This role will include providing surveillance level oversight, laboratory performance evaluation, and data quality validation with QA/QC reviews of all data included in final Phase II ESA reports for properties that are assessed as part of this project. The Consultant QA/QC Officer will not take part in data collection activities. The Consultant QA/QC Officer for this project is:

Mr. Craig D. Eaton, P.G.
Terracon Consultants, Inc.
6949 South High Tech Drive
Midvale, UT 84047
Phone: (801) 746-5446
Email: craig.eaton@terracon.com

EPA Project Officer

The EPA Project Officer will review and approve the QAPP,SAPs, and revisions in terms of quality-assurance aspects; review and approve site eligibility determinations; provide technical assistance to the Grantee; review progress reports; and review draft and final reports when requested. The EPA Project Officer is:

Ms. Christina Wilson
1595 Wynkoop Street
Denver, Colorado 80202
Phone: (303) 312-6706
Email: Wilson.Christina@epa.gov

UDEQ Project Manager

If impacted environmental media (e.g., soil, groundwater, surface water) are identified during assessment activities, the UDEQ will be the agency providing oversight for any subsequent cleanup activities that may be undertaken (which are beyond the scope of assessment activities). The UDEQ will remain a technical resource for the field activities and reporting throughout the course of the project. The UDEQ Project Manager for this project is:

Mr. Joseph Katz
Utah Department of Environmental Quality
Division of Environmental Response and Remediation
P.O. Box 144840
Salt Lake City, UT 84114-4840
(801) 536-4104
Email: jkatz@utah.gov

Environmental Laboratory: ESC Lab SciencesSamples of environmental media that are collected during the course of Phase II ESAs will be analyzed by ESC Lab Sciences. ESC Lab Sciences is an environmental analytical firm providing technical and support services to customers nationwide, with a diverse accreditation/certification program which represents over 48 separate state and national accreditations. ESC Lab Sciences is responsible for providing reliable and high-quality analytical data, using the quality systems detailed in its Quality Assurance Manual (Appendix A of this QAPP). The Quality Assurance Director for ESC Lab Sciences is responsible for managing the implementation, monitoring, and development of the laboratory's Quality Assurance Systems as well as overseeing laboratory safety, waste management, internal and external audits, and new method implementation. The Environmental Laboratory and Quality Assurance Director are:

ESC Lab Sciences
Steve Miller, Laboratory Quality Assurance Director
12065 Lebanon Road
Mt. Juliet, Tennessee 37207
Phone: (615) 773-9684
Email: smiller@esclabsciences.com

A5 Problem Definition/Background

A5.1 Purpose /Background

A Brownfield is a real property, the expansion, redevelopment, or reuse of which may be complicated by the real or potential presence of a hazardous substance, pollutant, or contaminant. Salt Lake County (the Grantee) is a recipient of an EPA community-wide assessment grant to inventory, characterize, assess, and conduct cleanup planning along with public outreach activities for eligible Brownfield sites located within County boundaries, including, but not limited to: metro townships, incorporated cities, and unincorporated areas/islands. This grant program will help evaluate select County properties that have an established history of petroleum or hazardous substance impacts, where significant uncertainty exists due to real or perceived contamination, and will benefit from EPA grant funds to support a range of environmental assessment work and cleanup planning targets.

As qualified and eligible high-priority properties are identified within the County, Phase I ESAs will be conducted on selected properties. The Phase I ESAs will be conducted consistent with the procedures included in ASTM E1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* and EPA's All Appropriate Inquiries Rule (Code of Federal Regulations, Title 40, Part 312: Innocent Landowners, Standards for Conducting All Appropriate Inquiries).

In cases where the Phase I ESAs identify Recognized Environmental Conditions (RECs), Phase II ESAs will subsequently be conducted to investigate the identified RECs. The Phase II ESAs will be conducted consistent with ASTM E1903-11 *Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process*. The Phase II ESAs will generally include sampling and analysis of environmental media (for example, soil, groundwater, surface water, or soil vapor) to develop environmental condition profiles. The resulting analytical data from Phase II ESAs will be compared against applicable screening levels (as outlined in Section A7.2) to allow evaluation of whether site redevelopment can occur without environmental remedy, or to support planning for an appropriate remedial response. This community-wide QAPP details quality assurance procedures that are applicable to all Phase II ESAs that will be conducted under the assessment grant. In addition to this QAPP, a separate site-specific Sampling and Analysis Plan (SAP) will be developed for each site that is identified for subsequent Phase II assessment. The site-specific problem definition and decisions to be resolved will be detailed in each SAP, and will depend upon conditions at each site including

- Site physical characteristics
- Proposed future use and/or redevelopment plan
- Historical and current uses
- Findings of previous investigations
- Known or anticipated contaminants

Each SAP will identify the specific investigation approach, sampling locations and rationale, and laboratory analyses that are applicable to each individual site, and will be developed and approved by the Agencies prior to conducting the Phase II ESA.

A6 Project Task/Description and Schedule

The results of Phase I ESAs, at sites where RECs are identified, will be used as a basis for planning subsequent Phase II ESAs. A SAP will be developed for the Phase II assessment to be conducted on each selected property; each SAP will detail the contaminants of concern, sampling locations, and sampling rationale for that particular site. Potential contaminants of concern may include, but are not limited to, petroleum hydrocarbons, oil and grease, solvents, and heavy metals. A Phase II ESA will be conducted at each site only after the corresponding site-specific SAP has been developed and approved by the Agencies.

Work schedules, detailed geographical locations to be studied, and resource and time constraints for each Phase II ESA will be included in the individual SAP.

A7 Quality Objectives and Criteria for Measurement Data

A7.1 Data Quality Objectives

Data Quality Objectives (DQOs) are quantitative and qualitative statements that specify the quality of data required to support the objectives of an investigation. DQOs are generated through the DQO Process, as shown in Guidance on Systematic Planning Using the Data Quality Objectives Process (QA/G-4) (EPA; February, 2006).

A7.2 Measurement Performance Criteria

Table 1 provides measurement performance criteria, which are Data Quality Indicators (DQIs) expressed in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity (PARCCS). The DQIs provide verifiable measurement criteria to assess data quality. Following is a brief definition of the PARCCS parameters, including bias.

Precision	The measure of agreement among repeated measurements of the same property under identical, or substantially similar conditions; calculated as either the range or as the standard deviation. Precision may also be expressed as a percentage of the mean of the measurements, such as relative range or relative standard deviation (coefficient of variation).
Bias	The systematic or persistent distortion of a measurement process that causes errors in one direction. Use reference materials or analyze spiked matrix samples.
Accuracy	A measure of the overall agreement of a measurement to a known value; includes a combination of random error (precision) and systematic error (bias) components of both sampling and analytical operations.
Representativeness	A qualitative term that expresses "the degree to which data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, a process condition, or an environmental condition." (ANSI/ASQC 1995)
Comparability	A qualitative term that expresses the measure of confidence that one data set can be compared to another and can be combined for the decision(s) to be made.
Completeness	A measure of the amount of valid data needed to be obtained from a measurement system.

Sensitivity	The capability of a method or instrument to discriminate between measurement responses representing different levels of the variable of interest.

The Consultant QA/QC Officer will evaluate the PARCCS parameters in terms of the DQIs presented in Table 1. Precision will be evaluated on the basis of relative percent difference (RPD) as a measure of reproducibility between LCS/LCSD pairs and MS/MSD pairs (analytical precision), and between field samples and field duplicate samples (field precision). Bias and Accuracy will be evaluated through a review of the method blanks, LCS/LCSD, and MS/MSD summaries provided by the laboratory. Method blank analyte concentrations are expected to be below laboratory reporting limits, while LCS/LCSD and MS/MSD pairs are expected to be within the laboratory/method standards. Representativeness will be ensured by use of appropriate sampling locations, collection and preservation methods (including sample holding times), and analytical procedures according to the approved SAPs. Comparability will be ensured through the use of standardized sampling procedures in accordance with the approved SAP and QAPP, use of standardized and approved laboratory analytical methods, and reporting the analytical results in appropriate and consistent units. Completeness is the ratio of valid measurements to the number of planned measurements, expressed as a percentage, and the completeness goal for the project is 90%. The level of sensitivity must be such that the laboratory reporting limits are sufficiently low as to allow identification of analyzed constituent concentrations that are above applicable regulatory screening levels.

Soil and groundwater samples submitted for laboratory analyses will be considered definitive, consistent with EPA Superfund Data Categories (EPA; September 1993). Analytical results will be evaluated using current EPA Regional Screening Levels (RSLs), Utah's Groundwater Quality Standards, and the US EPA's Vapor Intrusion Screening Levels and Maximum Contaminant Levels, as applicable. Petroleum hydrocarbon impacts suspected to originate from an underground storage tank will be evaluated using the Utah Department of Environmental Quality, Division of Environmental Response and Remediation, Leaking Underground Storage Tank Program's Cleanup Levels (i.e., Initial Screening Levels and Tier 1 Screening Levels). Results for asbestos samples, if collected, will be compared to standards at U.S. EPA 40 CFR Part 60 Subpart M (Asbestos NESHAP) and Utah Department of Environmental Quality, Division of Air Quality standards (UAC R307-801), and lead-based paint samples, if collected, will be compared to HUD Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing. As such, the level of data sensitivity is required to result in laboratory reporting limits (practical quantitation limits or PQLs) that are below the regulatory screening levels listed above.

Certification and validation requirements apply to the laboratory. Regularly scheduled analyses of known duplicates, standards, and spiked samples are a routine aspect of data reduction, validation, and reporting procedures for the laboratory. The laboratory, which is associated with the National Environmental Laboratory Accreditation Program (NELAP), will verify the reliability and credibility of the analytical results. Additionally, the laboratory reporting limits need to be

lower than the screening levels for each of the analytes analyzed. A copy of the ESC Lab Sciences (ESC) Quality Assurance Manual (QAM) with the laboratory reporting levels is provided in **Appendix A**.

A8 Special Training Requirements

The Occupational Safety and Health Administration (OSHA) 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) training, including an up-to-date 8-hour refresher course as required by OSHA, is required for field personnel. Initial 40-hour HAZWOPER "live" training is provided by reputable training providers in the local community, and annual refreshers are provided either by "live" training or via online courses approved by Terracon's Corporate Safety and Health Manager. The Consultant Project Manager will ensure that training/certification requirements are satisfied for all field personnel prior to their entry to any project site where Phase II ESA activities are conducted. Documentation (training certificates) of HAZWOPER and refresher training is maintained by Terracon's Corporate Safety and Health Manager in employees' confidential medical surveillance/environmental training files. In addition, Terracon's environmental project managers (or designees) are responsible for conducting site-specific safety briefings prior to beginning all Terracon hazardous waste site projects. Terracon will prepare a site-specific Health and Safety Plan (HASP) prior to mobilizing to the site to identify specific hazards that may be encountered during all phases of the field work. Terracon will also require any onsite subcontractors (e.g., drillers) to provide documentation of current HAZWOPER certification prior to mobilization. In addition, Terracon personnel that collect samples of potential asbestos-containing material will be Certified Asbestos Building Inspectors as required by Utah Division of Air Quality rules at UAC R307-801. Terracon personnel who engage in lead-based paint activities, if needed, will meet applicable Utah Division of Air Quality certification requirements at UAC R307-842. Terracon personnel who conduct hazardous materials surveys will be Pre-Demolition Inspectors certified by the Salt Lake Valley Health Department. Documentation of these certifications is maintained in Terracon databases at both the local and corporate levels.

A9 Documentation and Records

The data collected during the assessments will be summarized in Phase II ESA reports documenting the investigation procedures and results, along with supporting maps, figures, and data summary tables. Appendices will include appended data for analyses, including laboratory QA/QC evaluation, chain of custody documentation, and field forms. Phase I ESA reports, where prepared, will be prepared consistent with ASTM E1527-13 and Phase II reports will be prepared consistent with ASTM E1903-11. Phase II reports will include discussion and general recommendations for identified conditions that must be considered in planning for future redevelopment, as applicable. These may include, for example, impacted environmental media and/or building-related conditions such as asbestos and other hazardous materials that require further investigation, cleanup, or proper management as part of building demolition/renovation. As requested by Salt Lake County, separate cleanup planning documents will be developed for

those sites where cleanup has been deemed necessary; the planning documents will not be a complete Remedial Action Plan, but will help outline a specific cleanup path.

Field personnel will maintain a field log to record pertinent activities associated with sampling activities. Photographic documentation will also be recorded in the field log, as will documentation of any field problems and corrective measures taken. Additional field documents will include sketch maps, field forms, borehole logs, and chain of custody records.

Labels generated by the laboratory will be affixed to sample containers and completed by field personnel. The labels will identify sample numbers, dates and times collected, and requested analyses. Chain of custody records will be maintained for all samples from the time of collection through the time of submittal to the laboratory for analysis.

Electronic project documents (including but not limited to word processing files, spreadsheets, laboratory analytical reports, project photographs, and CAD/GIS files) will be stored for a minimum of five years in an electronic project folder on a local server hard drive in the Terracon office that is backed up automatically on a daily basis to a separate file server hard drive at Terracon's corporate office in Olathe, Kansas. In addition, analytical reports and chain-of-custody records will be maintained indefinitely on the analytical laboratory's LIMS database, and made available via the laboratory's secured online data access system.

Samples will be submitted to the laboratory, using standard turnaround times unless alternate turnaround times are requested on chain of custody records for individual sample sets. It is anticipated that ESC will be used for analyses; ESC is certified with the State of Utah. If another laboratory performs analyses, it must meet the following criteria and submit QA/QC documentation to the EPA for approval as described above:

- Demonstrated ability to achieve the required detection limits;
- Certified by the State of Utah for the specific analyses;
- Ability to meet the project's analytical QC requirements, which includes a laboratory method blank, laboratory control sample, matrix spike and matrix spike duplicate performed on one of the project's samples, chromatograms, and narrative report of QC results and any corrective actions required; and
- Follows an internal QA/QC Program.

Details of the laboratory QA/QC Program are presented in **Appendix A**.

GROUP B MEASUREMENT/DATA ACQUISITION

B1 Sampling Process Design

Site-specific SAPs will be developed to include each site selected for Phase II ESA investigation. Regulatory and historical data collected during the Phase I ESA, a visual inspection of the property, and any identified RECs will be used to develop the SAPs. Each SAP will be reviewed and approved by the Agencies prior to implementation.

B2 Sampling Methods Requirements

Samples will be collected following applicable Terracon Standard Operating Procedures (SOPs) included in **Appendix B**. The SOPs include lists of equipment needed for each SOP, and were developed in general accordance with *Guidance for Preparing Standard Operating Procedures (SOPs) (QA/G-6)* (U.S. EPA, April 2007). If problems develop in the field during implementation of an SOP, field personnel will contact the Consultant Project Manager and Consultant QA/QC Officer for information on appropriate corrective action, and the problem and corrective action will be documented in the field log book.

B3 Sample Handling, Preservation and Custody Requirements

Samples will be identified, labeled, preserved, and handled following SOP 20, which includes chain of custody and documentation procedures. An example sample label and chain of custody form are included as attachments to SOP 20.

Required sample containers, sample volumes, sample holding times, and sample preservation methods for a variety of analytical parameters including those that are likely to be used in the assessments are summarized in Table 14.6 of Appendix III to the ESC QAM, see **Appendix A** of this QAPP. The primary analytical parameters anticipated for the assessments include, but are not limited to, the following: volatile organic compounds (EPA Method 8260); semi-volatile organic compounds (EPA Method 8270); total petroleum hydrocarbons – gasoline range organics (EPA Method 8260); total petroleum hydrocarbons-diesel range organics (EPA Method 8015); oil & grease (EPA Methods 1664/9071); and metals (EPA Methods 6010//6020/7470/7471).

Samples will be placed into the appropriate laboratory-provided container immediately after collection. The container will remain in the sight of the sampler or will be locked in a secured area until the samples are transported under chain of custody protocols for delivery to the laboratory.

B4 Analytical Methods Requirements

All analytical methods will follow standard EPA procedures as outlined in Test Methods for Evaluating Solid Wastes - Physical/Chemical Methods (SW-846) as updated. Please refer to

SW-846 and the ESC QAM (**Appendix A** of this QAPP) for analytical SOPs and information regarding analytical equipment, instrumentation, performance criteria, corrective action procedures and documentation, sample disposal, and method validation information and procedures for nonstandard methods. Laboratory turnaround times needed will be specified on chain of custody records for each sample set, but will typically be the standard ESC turnaround time of 7 working days.

B5 Quality Control Requirements

B5.1 Definitive Data

To ensure that high quality, reliable data are consistently collected, and that data are comparable to previous investigations, QA procedures will be followed throughout the investigation. Quality assurance procedures include using the data quality objectives, following SOPs, and collecting and analyzing field and laboratory QC samples.

QC samples collected in the field will be preserved, handled, and transported in an identical manner as the environmental samples. QC samples will include the following:

- Field duplicates
- Field/Equipment blanks (if applicable for individual sites)
- Trip blanks (if applicable for individual sites)
- Matrix spikes and matrix spike duplicates (MS/MSDs)
- Laboratory method blanks
- Laboratory control samples (LCS)

Quality control samples are briefly described below.

Field Duplicate Samples. To evaluate sampling and laboratory precision, field duplicate samples may be collected, as specified in the site-specific SAP. One sample set will be labeled with the correct sample identification, while the other will be labeled with a false or “blind” sample identification. If the detected analytes in the field sample and its duplicate are less than 5 times the laboratory reporting limit (LRL) and the difference between the reported concentration in the sample and the reported concentration in the duplicate is less than or equal to the LRL value (for aqueous samples) or less than twice the LRL (for soil/solid samples), the samples will be considered within control. If the difference is greater than the LRL value, the data will be flagged and evaluated by the Consultant QA/QC Officer.

The relative percent difference (RPD) between detected analytes in the field sample and its duplicate are calculated when the reported concentrations for the sample and duplicate are greater than or equal to 5 times the LRL. The RPD is calculated to evaluate precision using the following equation.

RPD = $\frac{X_1 - X_2}{\left(\frac{X_1 + X_2}{2}\right)} x100$ Where X_1 and X_2 are the reported concentrations of the samples being evaluated.

The target RPD values for samples and their duplicates will be ±25% (for aqueous samples) and ±50% (for solid samples, due to greater sample heterogeneity). If samples exceed the target RPD values, the data will be flagged and evaluated by the Consultant QA/QC Officer. The samples may be used on a conditional basis if sample heterogeneity or matrix interference appears to be the cause of the high RPD value.

Field/Equipment Blank. Field equipment blanks may be collected, as specified in the site-specific SAP. Acceptance criteria will be analyte concentrations less than the LRLs. If above the LRLs, the data will be flagged and evaluated by the Consultant QA/QC Officer. The Consultant QA/QC Officer will review the sampling procedures and equipment to determine if contaminants could have been introduced by the sampling methodology. When necessary, the results will be discussed with the Agencies, laboratory personnel, and/or appropriate regulatory officials to determine if the data are acceptable or should be rejected.

Trip Blanks. Trip blanks will apply only when a Phase II ESA includes collection of samples to be analyzed for volatile organic compounds (VOCs) and will be used to evaluate whether external VOCs from bottle handling and analytical processes, independent of the field sampling processes, are contaminating the samples. Trip blanks will be prepared by the laboratory with analyte-free water prior to the sampling event, kept with the investigative samples throughout the sampling event, and returned to the laboratory with the other samples for analysis. One trip blank will typically be used and analyzed per site where sample analyses will include VOCs.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Samples. Samples for MS/MSD analyses will be selected by the laboratory from the sample set at random and split in the laboratory. The MS/MSD samples will be spiked in the laboratory with target analytes prior to extraction or analysis, according to the laboratory's SOPs, and then analyzed for the same compounds as the environmental samples. Each MS/MSD will be evaluated for Percent Recovery (PR). If the data meets the PR criteria, the MS/MSD will be evaluated for RPD according to the equation presented above.

Percent Recovery = $\frac{X_s - X_i}{SC} x100$ Where X_s = concentration measured in spiked sample
X_i = concentration measured prior to spiking, and
SC = spike concentration

The PR acceptance criteria for MS/MSD samples will vary by sample medium, analyte, and analytical method, and may be either method defaults or laboratory-derived. Laboratory RPD acceptance criteria also vary by sample medium, analyte, and analytical method, and are specified in the ESC QAM (**Appendix A** of this QAPP). Each laboratory report will include quality control summaries with PR results and comparison against PR acceptance criteria for each sample medium, analyte, and analytical method for that sample set. If data fail to meet the

acceptance criteria, the Consultant QA/QC Officer will evaluate the data with the laboratory to determine potential causes of failure, such as matrix interference or sample heterogeneity. Data may be flagged or invalidated based on discussions with the laboratory.

Laboratory Method Blanks. Method blank samples will be prepared by the laboratory and analyzed with each analytical batch for each method. A method blank consists of laboratory-grade deionized water or solid that is processed through all of the analytical steps required by a method, including sample extraction, preparation, and analysis. Laboratory method blank samples are used to identify contamination originating in the laboratory, such as laboratory water, reagents, sample preparation steps, and instrument contamination. Method blank samples aid in distinguishing low-level field contamination from laboratory contamination. Method blank samples will be run with each batch of samples (20 or fewer samples per batch). If analytes are detected in the method blank, the laboratory will correct problems as per their SOPs.

Laboratory Control Samples (LCS). Laboratory control samples are used to evaluate laboratory accuracy in the absence of matrix interference. A laboratory control sample is composed of laboratory-grade deionized water or clean solid that is spiked with target analytes according to the laboratory's SOPs prior to extraction or analysis. The percent recovery of the spiked compounds is calculated and compared to established QC limits using the following formula.

Percent Recovery = $\frac{X_S}{SC} x 100$ Where X_S = concentration measured in spiked sample, and SC = spike concentration

Acceptance criteria for the LCS will vary by sample medium, analyte, and analytical method; may be either method defaults or laboratory-derived; and are compared against PR results in the laboratory quality control summaries provided as part of each laboratory report. If the LCS is out of control, the laboratory will correct problems in accordance with its standard operating procedures.

Holding Times. Holding times are used to evaluate the representativeness of the environmental samples. Holding time is the period following sample collection when a sample is considered representative of the environmental conditions. The holding time for each analysis will be compared to the method-specific holding times. Samples held beyond their holding time prior to analysis will be rejected.

B5.2 Non-definitive data

Non-definitive data utilized to support decisions may include field soil screening measurements and observations, physical observations, and groundwater field parameter measurements. Non-definitive data will be collected following Terracon SOPs **(Appendix B)**. The QC documentation for non-definitive data is not as rigorous as requirements for definitive data.

B6 Equipment Testing, Inspection, and Maintenance Requirements

Testing, inspection, and maintenance of sampling equipment and field instrumentation will be performed by Terracon field personnel prior to each day's field use and in accordance with the procedures and schedules in the manufacturers' specifications. A supply of appropriate spare parts and batteries will be maintained with each instrument in its transport case, along with instrument calibration supplies. Any identified deficiencies will be documented in the field log book, along with any corrective actions (e.g., spare parts replacement and instrument re-testing) and effectiveness of corrective actions.

ESC conducts its own equipment testing, inspections, maintenance, and record keeping of the laboratory equipment as detailed in the laboratory's QAM provided in **Appendix A**.

B7 Instrument/Equipment Calibration and Frequency

B7.1 Field Instruments

Field instruments will be calibrated daily or in accordance with manufacturers' specifications by Terracon field personnel, using National Institute of Standards and Technology (NIST) standards or equivalent. Calibration deficiencies, if any, will be documented in the field log book along with their resolution (e.g., spare parts replacement and re-calibration).

B7.2 Laboratory Instruments

ESC's QAM and SOPs meet all State of Utah, The NELAC Institute, and EPA method protocols necessary to produce legally and defensible analytical data, as indicated in the Utah Environmental Laboratory Certification Program (ELCP) document. Certification also applies to instrument calibration, reference material, standards traceability, data validation, and all other aspects of ESC's QAM.

In the event of a negative audit finding or any other circumstance, which raises doubt concerning the laboratory's competence or compliance with required procedures, the laboratory ensures that those areas of concern are quickly investigated. A resolution of the situation is promptly sought and, where necessary, recalibration and retesting is conducted. Records of events and corrective actions taken by the laboratory to resolve issues and to prevent further occurrences are maintained. Additional information on laboratory corrective actions is described in Section 4.11 of ESC's QAM.

B8 Inspection/Acceptance Requirements for Supplies and Consumables

Sample containers and other dedicated consumables will meet EPA criteria for cleaning procedures required for low-level chemical analysis. Sample containers will have Level II certification provided by the manufacturer, in accordance with pre-cleaning criteria established by EPA in "*Specifications and Guidelines for Obtaining Contaminant-Free Sample Containers*."

The certificates of cleanliness are maintained by the container suppliers, and can be obtained upon request using the container batch and lot numbers. Sample containers and sample preservatives (where applicable) will be provided by the laboratory. The containers shall be pre-preserved by the laboratory, if required. In addition, the laboratory will supply the laboratory-grade deionized water for the field and equipment blanks. The laboratory-grade deionized water may be prepared by the laboratory in-house, but the laboratory must have a routine procedure in place to analyze the water to ensure the deionized water's quality. New disposable nitrile sampling gloves will be used during collection of samples, and will be discarded after collection of each sample. New disposable water filters (if required), bailers, and/or tubing will be used to collect groundwater samples and will be discarded after use. Prior to use, the materials provided by the laboratory or other suppliers will be inspected visually for signs of tampering, contamination, or damage. No evidence of tampering, contamination, or damage will be acceptable. The field team leader will be responsible for the inspection. Reserves of field supplies and consumables are stored and maintained in Terracon's secured storage warehouse and used as needed by field personnel for each day's field activities, and the reserves of consumables are re-ordered/replenished as needed by Terracon staff.

B9 Data Acquisition of Non-direct Measurements

Additional data may be collected and used for site characterization following SOPs. QA procedures will be followed throughout the investigation. External sources of existing data may also be used (for example, computer databases or regulatory files of previously investigated sites); such information will be used only for reference. This type of data will be considered non-definitive for the purpose of assessing selected sites, unless the data was collected following an Agency-approved SAP, evaluated following a QAPP that meets or exceeds the requirements provided in this QAPP, validated, and deemed definitive.

B10 Data Management

The results of each investigation will be compiled and detailed in a report. Please refer to Section A9 for information pertaining to documentation that will be generated during the course of the project, and storage requirements for these records.

Data will be processed using commercially available word processing, spreadsheet, and/or database programs. During transcription of field measurements, each entry will be double-checked immediately after each transcription from field log books and forms. Example forms for typical field data collection are included in **Appendix B**. To minimize potential errors in laboratory data transcription, the use of electronic data deliverables (EDDs) will be maximized during data entry to summary tables and databases. The control mechanism to detect and correct possible errors in data transcription, reduction, reporting, and data entry to forms, reports, and databases will be the senior peer review of documents by the Consultant Project Manager and Consultant QA/QC Officer. Data will be stored electronically, both on a local server hard drive (subject to daily backup on a separate file server at Terracon's corporate office

in Olathe, KS) and on the laboratory's LIMS database system, and can be retrieved via the local server and via the laboratory's secured online data access system. Please refer to **Appendix A** (ESC QAM) for information relating to procedures used and individuals responsible for laboratory data processing, transmittal, storage/archival, and hardware/software configurations.

GROUP C ASSESSMENT/OVERSIGHT

C1 Assessment Activities

Assessment and oversight activities will be conducted by the Consultant QA/QC Officer. There will be three primary activities conducted by the Consultant QA/QC Officer:

1) Surveillance Level Oversight

The Consultant Project Manager will coordinate the investigation, with independent oversight by the Consultant QA/QC Officer. Both of these individuals will have authority to stop work in the event of unsafe work conditions or deviation from SOPs. In the event of unsafe work conditions, field personnel will also have authority to stop work and will immediately contact the Consultant Project Manager for resolution. Any deviations from the QAPP will be addressed immediately to ensure the quality of the data. Surveillance level oversight will be conducted throughout the duration of field activities.

2) Performance Evaluations

The Consultant QA/QC Officer will verify that the laboratory certifications and methods are current and approved by the NELAP, prior to the initiation of field sampling.

3) Data Quality Validation Summary

Within approximately one week of receipt of analytical data sets from the laboratory, the Consultant Project Manager will perform an initial review of the data, followed by a data validation review by the Consultant QA/QC Officer to determine whether DQOs were met and evaluate the overall usability of the data. The results of these data validation reviews will be communicated to the Consultant Project Manager, who will immediately notify the laboratory if any need for corrective actions is identified. In this case, the laboratory will be required to perform and verify any corrective actions taken, which will then be documented in an amended laboratory report identifying the corrective actions taken and any resulting changes to the analytical results. In addition, the data validation reviews will form the basis for development of data validation summaries for inclusion with the final site investigation reports.

C2 Reports to Management

Data validation summaries will be included as part of the final reports detailing the investigations. In the event that laboratory corrective actions are required, the Consultant Project Manager will notify Salt Lake County, and final reports will include copies of both the

original and amended laboratory reports. In the event that field corrective actions are required, the problem and corrective action will be recorded in the field log book, and will also be documented in the final report. Copies of the final reports detailing the investigations will be sent to all parties listed in **Section A3 Distribution List**.

GROUP D DATA VALIDATION AND USABILITY

D1 Data Review

Following receipt of the laboratory analytical results and initial review by the Consultant Project Manager, the data will be forwarded to the Consultant QA/QC Officer for review which will include initial screening to evaluate whether any of the data is flagged or if laboratory control limits were not met. Upon acceptance of the data from the laboratory, the data will be validated. The data validation process evaluates whether the specific requirements for an intended use have been fulfilled and ensures that the results conform to the users' needs.

D2 Validation and Verification Methods

All laboratory data will be subject to internal reduction and validation by the laboratory prior to external release of the data, as detailed in the laboratory's QAM (Section 12 of the QAM Appendices IV through XIII) in **Appendix A**.

Following receipt of data released by the laboratory, additional data validation and verification will be conducted by the Consultant QA/QC Officer, using the criteria described in **Section B5.1** and **Table 2**, and including review of chain of custody and laboratory log-in records. Data will be reviewed as it is received throughout the project. Each laboratory data set will be provided by the laboratory as a Level III data package which will include the final analytical report with qualifiers where necessary; chain of custody records; and results for method blanks, MS/MSD analyses with control limits; LCS summary with control limits; reporting limits listed on all reports; surrogate recoveries for GC and GC/MS analyses; initial and continuing calibration information; and instrument blank performance.

Laboratory QC issues will be addressed by communication between the Consultant QA/QC Officer and laboratory personnel. Problems identified in sample collection, handling, preservation, and documentation will be addressed with the Consultant Project Manager and field staff.

Any deviations from the QA goals will be evaluated in terms of their effect on data usability. The degree of sample deviation beyond the acceptance limit will be evaluated for its potential effect on data usability, contribution to the quality of the reduced and analyzed data, and on decision-making for the project.

D3 Reconciliation with User Requirements

Following the validation of field and laboratory data, all data and information will be reconciled with the project objectives to assess the overall success of sampling activities. Qualitative DQOs will be reviewed through a narrative discussion of the results to including limitations, if any, on data use due to uncertainties posed by any flagged data or elevated laboratory reporting limits. If such uncertainties result in significant hindrances to data usability, practical followup actions (for example, limited resampling) may be recommended as warranted.

Table 1
Data Quality Indicators (DQIs)

Parameter	QC Program	Evaluation Criteria	Summary of QA/QC Goals
Precision	Field Duplicate Pairs	RPD[a]	RPDs will be less than ± 25% (aqueous samples) and ± 50% (solid samples) when detected concentrations are ≥ 5x the LRL. When detected concentrations are <5x the LRL and the difference between the reported concentrations is less than or equal to the LRL value (for aqueous samples) or less than twice the LRL (for soil/solid samples), the samples will be considered within control.
Bias	Laboratory Control Sample	Percent Recovery[b]	LCS percent recoveries will vary by sample medium, analyte, and method, and may be either method defaults or laboratory-derived.
	Matrix Spike/Matrix Spike Duplicate (MS/MSD)	Percent Recovery[b] RPD[a]	MS/MSD percent recoveries and RPDs will vary by sample medium, analyte, and method, and may be either method defaults or laboratory-derived.
Accuracy[c]	Method Blanks	LRL	Less than LRL
	Equipment Blanks	LRL	Less than LRL
Representativeness	Standard Operating Procedures (SOPs)	Qualitative determination of SOP adherence	All samples collected following SOPs
	Holding Times	Holding Times	All samples analyzed within holding times
	Field/Equipment Blanks	LRL	Less than LRL
Comparability	Units of Measure	Metric Units	100% of sample results reported in same units
	Analytical Methods	Approved Methods	100% of samples analyzed using approved methods
	Standardized Sampling	Qualitative determination of SOP adherence	All samples collected following SOPs
	QC Samples 10% Field Duplicates 10% Field Blanks Lab QA	 Verify Verify Verify	 100% compliance 100% compliance 100% compliance
Completeness	Complete Sampling	Percent Valid Data	90% or more of the planned measurements are valid
Sensitivity	Sample analyses	LRL	100% of LRLs are less than Performance Standards

a: RPD = $\frac{X_1-X_2}{\left(\frac{X_1+X_2}{2}\right)}x100$; where X_1 and X_2 are the reported concentrations of the samples being evaluated.

b: Percent Recovery = $\frac{X_s-X_i}{SC}x100$; where X_s = concentration measured in spiked sample, X_i = concentration measured prior to spiking, and SC = spike concentration.

c: Instrument calibration, reference material, standards traceability, and data validation will follow ESC's Standard Operating Procedures.

LRL - Laboratory Reporting Limit
RPD - Relative Percent Difference
SOP - Standard Operating Procedure

Table 2
Data Validation and Verification Methods

Data Validation and Verification Requirements	Data Validation and Verification Methods
n Samples were collected as per scheduled locations and frequency.	n Comparison with Sampling & Analysis Plans.
n Sample collection and handling followed specific procedures (i.e., relevant SOPs and chain of custody procedures).	n Review of field notes, sampling logs and COCs. n Surveillance-level oversight of field procedures to maximize consistency in field.
n Appropriate analytical methods were used, and internal laboratory calibration checks were performed according to the method-specified protocol.	n Review of analytical methods and case narratives provided with laboratory reports. n Maintain documentation of communications with laboratory regarding problems or corrective actions.
n Required holding times and laboratory reporting limits were met.	n Comparison with specified holding times and LRLs.
n Recovery acceptance limits for field and laboratory QC samples (MS/MSD, LCS, and method blanks) were met.	n Comparison with specified acceptance limits. n Comparison with Data Quality Indicators.
n Appropriate steps were taken to ensure the accuracy of data reduction, including reducing data transfer errors in the preparation of summary data tables and maps.	n Maintaining a permanent file of hard copies of laboratory analytical reports. n Minimizing retyping of data. n Double-checking values entered into database, tables, and maps against laboratory reports.

NOTE: This QAM has been approved by the following people.

Peter Schulert, B.S., Chief Executive Officer 615-773-9660

John Mitchell, B.S., President 615-773-9653

Eric Johnson, B.S., Director of Operations 615-773-9654

Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Director, 615-773-9684

The ESC QAM has been prepared in accordance with the following standards: AIHA-LAP, A2LA, ISO/IEC 17025-2005, 2003 NELAC Standard, 2009 TNI Standard, and DOD QSM.

Disclaimer

This Quality Assurance Manual for ESC Lab Sciences is a living document. It is reviewed at least annually and revised when needed. The information stated herein is subject to change at any time due to updates to QC Limits, methods, operations, equipment, staff, etc.

Quality Manual: Table of Contents

Tables and Figures

1.0 GENERAL PURPOSE OF THIS QUALITY MANUAL

This quality manual documents the laboratory's management system and demonstrates the ability to execute the indicated tests and/or procedures and to meet regulatory requirements.

This manual establishes laboratory compliance with ISO (International Organization for Standardization) 17025, The NELAC Institute (TNI), Department of Defense Quality Systems Manual (DOD QSM), and the American Industrial Hygiene Association Laboratory Accreditation Program (AIHA-LAP).

2.0 LABORATORY BACKGROUND

2.1 ACTIVITIES

2.1.1 Analytical Support and Service Areas

ESC Lab Sciences is an environmental analytical firm providing technical and support services to customers nationwide. Specific service areas include the following:

- drinking water analysis
- industrial wastewater analysis
- hazardous waste characterization and identification
- groundwater analysis
- air analysis
- regulatory document guidance
- biological assessments
- mold identification
- solid/soil analysis and characterization
- industrial hygiene/environmental lead
- aquatic toxicity analysis
- cryptosporidium/giardia

2.1.2 Regulatory Compliance and Quality Standards

ESC is devoted to providing reliable and accurate data recognizing the necessity to establish sound, objective, and legally defensible positions or opinions for customers regarding compliance with governing regulations. ESC maintains quality systems that are compliant with the following Quality Standards: AIHA-LAP, A2LA, ANSI/ISO/IEC 17025, The TNI Standard, DOD QSM. The effectiveness of the quality system is measured by accreditation maintenance, internal and external audits, management reviews, proficiency sample testing, and an active preventive/corrective action system.

2.1.3 Analytical Capabilities:

Where mandated, only approved procedures are used for environmental analyses. ESC utilizes a number of method sources to accomplish project requirements. For NPDES and SDWA, methodologies are taken directly from 40 CFR parts 136 and 141.

For industrial hygiene analytical procedures, ESC utilizes guidance from NIOSH and OSHA published methods.

The following list is an example of the methodology ESC routinely performs:

Routine Methodology and Programs	
PROGRAM	***METHOD SOURCE***
NPDES	*EPA 821/R-93-010-A* *Methods for the Determination of Nonconventional Pesticides in Municipal and Industrial Wastewater, Volume I. Revision 1, August 1993.*
	40 CFR part 136
	Methods for Chemical Analysis of Water and Wastes (March 1983)
	Standard Methods for the Examination of Water and Wastewater (20ththrough 22nd editions)
AQUATIC TOXICITY	*7-Day Fathead Minnow (Pimephales promelas) Larval Survival and Growth Test; Test Method 1000.0 from "Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms" (EPA 821-R-02-013).*
	3-Brood Ceriodaphnia dubia Survival and Reproduction Test; Test Method 1002.0 from "Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms" (EPA 821-R-02-013).
	Fathead Minnow (Pimephales promelas) Acute Toxicity Test (24, 48 or 96 hour duration); referenced in "Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms" (EPA 821-R-02-012, 10-02).
	Ceriodaphnia dubia Acute Toxicity Test (24, 48 or 96 hour duration); referenced in "Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms" (EPA 821-R-02-012, 10-02).
SDWA	40 CFR parts 141
	Methods for Chemical Analysis of Water and Wastes (March 1983)
	Standard Methods for the Examination of Water and Wastewater (20ththrough 22nd editions)
	Methods for the Determination of Organic Compounds in Drinking Water - EPA/600/4-88/039 - December 1988 (Revised July 1991)
	Methods for the Determination of Organic Compounds in Drinking Water Supplement I, EPA/600/4-90/020 - July 1990
	Methods for the Determination of Organic Compounds in Drinking Water Supplement II, EPA/600/R-92/129 - August 1992
	EPA. Method 1622: *Cryptosporidium in Water by Filtration/IMS/FA, December 2005.*
	EPA. Method 1623: *Cryptosporidium and Giardia in Water by Filtration/IMS/FA, December 2005.*
RCRA	*SW-846, Test Methods for Evaluating Solid Wastes (3rd, 4th and online editions)*

2.2 HISTORY

ESC Lab Sciences was founded in 1970 by Dr. Arthur Schulert, a professor of Biochemistry at Vanderbilt University Medical School. The laboratory's first location was a 2,000 square foot building located in Mt. Juliet, TN.

ESC initially conducted several research contracts for the National Science Foundation. EPA Clean Water and Safe Drinking Water legislation of the early 1970s provided an additional market of Tennessee utilities and industries. ESC grew slowly for several years by increasing the share of the drinking and wastewater markets in Tennessee. In the late 1980s, ESC expanded its capabilities to include Underground Storage Tank testing and Biomonitoring/Toxicity testing.

Strategic expansion of the laboratory allowed ESC to provide support to large RCRA sites and add capabilities to offer analytical support for air and mold analyses. ESC is currently the nation's largest, single-location environmental laboratory operating in all US states. Our staff of over 300 employees works out of our 100,000 square feet, eleven-building facility approximately 20 minutes east of Nashville International Airport.

3.0 INTRODUCTION, SCOPE, AND DEFINITIONS

3.1 SCOPE OF CAPABILITIES

A list of approved and certified analytical capabilities can be found at the end of this section in Table 3.3b.

3.2 TABLE OF CONTENTS, REFERENCES AND APPENDICES

The table of contents is found at the beginning of this Manual. This Quality Manual uses the references from the 2003 NELAC Standard, Chapter 5, Appendix A and the 2009 TNI Standard (EL-V1M2-ISO-2009, Section 3.0).

3.3 DEFINITIONS AND TERMINOLOGY

The source of some of the definitions is indicated previous to the actual definition.

Table 3.3a Definitions

Acceptance Criteria	TNI and DoD- Specified limits placed on characteristics of an item, process, or service defined in requirement documents.
Accreditation	TNI and DoD- The process by which an agency or organization evaluates and recognizes a laboratory as meeting certain predetermined qualifications or standards, thereby accrediting the laboratory.
Accrediting Authority	DoD- The Territorial, State or Federal agency having responsibility and accountability for environmental laboratory accreditation and which grants accreditation.
Accrediting (or Accreditation) Body	DoD- Authoritative body that performs accreditation.
Accuracy	TNI and DoD- The degree of agreement between an observed value and an accepted reference value. Accuracy includes a combination of random error (precision) and systematic error (bias) components that are due to sampling and analytical operations; a data quality indicator.
Aliquot	DoD- A discrete, measured, representative portion of a sample taken for analysis.
Analysis Sequence	A compilation of all samples, standards and quality control samples run during a specific amount of time on a particular instrument in the order they are analyzed.
Analyst	TNI and DoD- The designated individual who performs the “hands-on” analytical methods and associated techniques and who is the one responsible for applying required laboratory practices and other pertinent quality controls to meet the required level of quality.
Analyte	DoD- The specific chemicals or components for which a sample is analyzed; it may be a group of chemicals that belong to the same chemical family, and which are analyzed together.
Analytical Reagent Grade	Designation for the high purity of certain chemical reagents and solvents assigned by the American Chemical Society.

Analytical Sensitivity	The lowest concentration that can be detected by the method. (e.g., for methods involving a count = 1 raw count calculated to the reporting units). Analytical sensitivity is commonly used in Mold analysis.
Analytical Uncertainty	TNI- A subset of Measurement Uncertainty that includes all laboratory activities performed as part of the analysis.
Assessment	TNI - The evaluation process used to measure or establish the performance, effectiveness, and conformance of an organization and/or its system to defined criteria (to the standards and requirements of laboratory accreditation). DoD- The evaluation process used to measure the performance or effectiveness of a system and its elements against specific criteria. Note: In this standard (DoD), assessment is an all-inclusive term used to denote any of the following: audit, performance evaluation, peer review, inspection, or surveillance.
Atomic Absorption Spectrometer	Instrument used to measure concentration in metals samples.
Atomization	DoD- A process in which a sample is converted to free atoms.
Audit	TNI- A systematic and independent examination of facilities, equipment, personnel, training, procedures, record-keeping, data validation, data management, and reporting aspects of a system to determine whether QA/QC and technical activities are being conducted as planned and whether these activities will effectively achieve quality objectives. DoD- A systematic evaluation to determine the conformance to quantitative and qualitative specifications of some operational function or activity.
Batch	TNI and DoD- Environmental samples that are prepared and/or analyzed together with the same process and personnel, using the same lot(s) of reagents. A **preparation batch** is composed of one to 20 environmental samples of the same quality systems matrix, meeting the above-mentioned criteria and with a maximum time between the start of processing of the first and last sample in the batch to be 24 hours. An analytical batch is composed of prepared environmental samples (extracts, digestates or concentrates) which are analyzed together as a group. An analytical batch can include prepared samples originating from various quality system matrices and can exceed 20 samples.
Bias	TNI- The systematic or persistent distortion of a measurement process, which causes errors in one direction (i.e., the expected sample measurement is different from the sample's true value).
Blank	TNI and DoD- A sample that has not been exposed to the analyzed sample stream in order to monitor contamination during sampling, transport, storage or analysis. The blank is subjected to the usual analytical and measurement process to establish a zero baseline or background value and is sometimes used to adjust or correct routine analytical results.
Blind Sample	DoD- A sub-sample for analysis with a composition known to the submitter. The analyst/laboratory may know the identity of the sample but not its composition. It is used to test the analyst's or laboratory's proficiency in the execution of the measurement process.
BNA (Base Neutral Acid compounds)	A list of semi-volatile compounds typically analyzed by mass spectrometry methods. Named for the way they can be extracted out of environmental samples in an acidic, basic or neutral environment.
BOD (Biochemical Oxygen Demand)	Chemical procedure for determining how fast biological organisms use up oxygen in a body of water.

Calibration	TNI and DoD- A set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or measuring system, or values represented by a material measure or a reference material, and the corresponding values realized by standards. 1) In calibration of support equipment, the values realized by standards are established through the use of reference standards that are traceable to the International System of Units (SI); 2) In calibration according to test methods, the values realized by standards are typically established through the use of Reference Materials that are either purchased by the laboratory with a certificate of analysis or purity, or prepared by the laboratory using support equipment that has been calibrated or verified to meet specifications.
Calibration Curve	TNI- The mathematical relationship between the known values, such as concentrations, of a series of calibration standards and their instrument response. DoD- The graphical relationship between the known values, such as concentrations, of a series of calibration standards and their instrument response.
Calibration Factor	The ratio of the detector response (peak areas or peak heights) to the amount (mass) of analyte in the calibration standard.
Calibration Method	DoD- A defined technical procedure for performing a calibration.
Calibration Range	DoD- The range of values (concentrations) between the lowest and highest calibration standards of a multi-level calibration curve. For metals analysis with a single-point calibration, the low-level calibration check standard and the high standard establish the linear calibration range, which lies within the linear dynamic range.
Calibration Standard	TNI- A substance or reference material used for calibration. DoD- A substance or reference material used to calibrate an instrument.
Certified Reference Material (CRM)	TNI- Reference material accompanied by a certificate, having a value, measurement uncertainty, and stated metrological traceability chain to a national metrology institute. DoD- A reference material one or more of whose property values are certified by a technically valid procedure, accompanied by or traceable to a certificate or other documentation which is issued by a certifying body.
Chain of Custody	DoD- An unbroken trail of accountability that verifies the physical security of samples, data, and records.
Chain of custody Form (COC)	TNI and DoD- Record that documents the possession of the samples from the time of collection to receipt in the laboratory. This record generally includes: the number and type of containers; the mode of collection, the collector, time of collection; preservation; and requested analyses.
Chemical Oxygen Demand (COD)	A test commonly used to indirectly measure the amount of organic compounds in water.
Client (referred to by ISO as Customer)	DoD- Any individual or organization for whom items or services are furnished or work performed in response to defined requirements and expectations.
Code of Federal Regulations (CFR)	A codification of the general and permanent rules published in the Federal Register by agencies of the federal government.
Comparability	An assessment of the confidence with which one data set can be compared to another. Comparable data are produced through the use of standardized procedures and techniques.

Completeness	The percent of valid data obtained from a measurement system compared to the amount of valid data expected under normal conditions. The equation for completeness is: % Completeness = (Valid Data Points/Expected Data Points)*100
Confirmation	TNI and DoD- Verification of the identity of a component through the use of an approach with a different scientific principle from the original method. These may include, but are not limited to: second-column confirmation; alternate wavelength; derivatization; mass spectral interpretation; alternative detectors; or additional cleanup procedures.
Conformance	DoD- An affirmative indication or judgment that a product or service has met the requirements of the relevant specifications, contract, or regulation; also the state of meeting the requirements.
Congener	DoD- A member of a class of related chemical compounds (e.g., PCBs, PCDDs).
Consensus Standard	DoD- A standard established by a group representing a cross-section of a particular industry or trade, or a part thereof.
Continuing Calibration Blank (CCB)	A blank sample used to monitor the cleanliness of an analytical system at a frequency determined by the analytical method.
Continuing Calibration Check Compounds (CCC)	Compounds listed in mass spectrometry methods that are used to evaluate an instrument calibration from the standpoint of the integrity of the system. High variability would suggest leaks or active sites on the instrument column.
Continuing Calibration Verification	DoD- The verification of the initial calibration that is required during the course of analysis at periodic intervals. Continuing calibration verification applies to both external and internal standard calibration techniques, as well as to linear and non-linear calibration models.
Continuing Calibration Verification (CCV) Standard	Also referred to as a CVS in some methods, it is a standard used to verify the initial calibration of compounds in an analytical method. CCVs are analyzed at a frequency determined by the analytical method.
Continuous Emission Monitor (CEM)	A flue gas analyzer designed for fixed use in checking for environmental pollutants.
Contract Laboratory Program (CLP)	A national network of EPA personnel, commercial labs, and support contractors whose fundamental mission is to provide data of known and documented quality.
Contract Required Detection Limit (CRDL)	Detection limit that is required for EPA Contract Laboratory Program (CLP) contracts.
Contract Required Quantitation Limit (CRQL)	Quantitation limit (reporting limit) that is required for EPA Contract Laboratory Program (CLP) contracts.
Control Chart	A graphic representation of a series of test results, together with limits within which results are expected when the system is in a state of statistical control (see definition for Control Limit)
Control Limit	A range within which specified measurement results must fall to verify that the analytical system is in control. Control limit exceedances may require corrective action or require investigation and flagging of non-conforming data.
Corrective Action	DoD- The action taken to eliminate the causes of an existing non-conformity, defect, or other undesirable situation in order to prevent recurrence.

Corrective and Preventative Action (CAPA)	The primary management tools for bringing improvements to the quality system, to the management of the quality system's collective processes, and to the products or services delivered which are an output of established systems and processes.
Data Audit	DoD- A qualitative and quantitative evaluation of the documentation and procedures associated with environmental measurements to verify that the resulting data are of acceptable quality (i.e. that they meet specified acceptance criteria).
Data Quality Objective (DQO)	Systematic strategic planning tool based on the scientific method that identifies and defines the type, quality, and quantity of data needed to satisfy a specified use or end user.
Data Reduction	TNI- The process of transforming the number of data items by arithmetic or statistical calculation, standard curves, and concentration factors, and collating them into a more usable form. DoD- The process of transforming raw data by arithmetic or statistical calculations, standard curves, concentration factors, etc., and collation into a more useable form.
Definitive Data	DoD- Analytical data of known quality, concentration and level of uncertainty. The levels of quality and uncertainty of the analytical data are consistent with the requirements for the decision to be made. Suitable for final decision-making.
Demonstration of Capability	TNI- A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision. DoD- A procedure to establish the ability of the analyst to generate acceptable accuracy.
Detection Limit (DL)	DoD- The smallest analyte concentration that can be demonstrated to be different than zero or a blank concentration at the 99% level of confidence. At the DL, the false positive rate is 1%.
Diesel Range Organics (DRO)	A range of compounds that denote all the characteristic compounds that make up diesel fuel (range can be state or program specific).
Digestion	DoD- A process in which a sample is treated (usually in conjunction with heat) to convert the sample to a more easily measured form.
Document Control	DoD- The act of ensuring that documents (and revisions thereto) are proposed, reviewed for accuracy, approved for release by authorized personnel, distributed properly and controlled to ensure use of the correct version at the location where the prescribed activity is performed.
Dry Weight	The weight after drying in an oven at a specified temperature.
Duplicate (also known as Replicate or Laboratory Duplicate)	DoD- The analyses or measurements of the variable of interest performed identically on two subsamples of the same sample. The results of duplicate analyses are used to evaluate analytical or measurement precision but not the precision of sampling, preservation or storage internal to the laboratory.
Electron Capture Detector (ECD)	Device used in GC methods to detect compounds that absorb electrons (e.g., PCB compounds).
Electronic Data Deliverable (EDD)	A summary of environmental data (usually in spreadsheet form) which customers request for ease of data review and comparison to historical results.
Eluent	DoD- A solvent used to carry the components of a mixture through a stationary phase.
Elute	DoD- To extract, specifically, to remove (absorbed material) from an absorbent by means of a solvent.
Elution	DoD- A process in which solutes are washed through a stationary phase by movement of a mobile phase.

Environmental Data	DoD- Any measurements or information that describe environmental processes, locations, or conditions; ecological or health effects and consequences; or the performance of environmental technology.
Environmental Monitoring	DoD- The process of measuring or collecting environmental data.
Environmental Sample	A representative sample of any material (aqueous, non-aqueous, or multimedia) collected from any source for which determination of composition or contamination is requested or required. Environmental samples can generally be classified as follows: • Air and Emissions – Gas or vapor collected in Tedlar bags, SUMMA canisters, sorbant tubes, impingers, filters, or other devices. • Non Potable Water (Includes surface water, ground water, effluents, water treatment chemicals, and TCLP leachates or other extracts) • Drinking Water - Delivered (treated or untreated) water designated as potable water • Water/Wastewater - Raw source waters for public drinking water supplies, ground waters, municipal influents/effluents, and industrial influents/effluents • Sludge - Municipal sludges and industrial sludges. • Soil - Predominately inorganic matter ranging in classification from sands to clays. • Waste - Aqueous and non-aqueous liquid wastes, chemical solids, and industrial liquid and solid wastes
Equipment Blank	A sample of analyte-free media used to rinse common sampling equipment to check effectiveness of decontamination procedures.
External Calibration Model	Comparison of instrument responses from the sample to the responses from the target compounds in the calibration standards. Sample peak areas (or peak heights) are compared to peak areas (or heights) of the corresponding analytes in calibration standards.
Facility	A distinct location within the company that has unique certifications, personnel and waste disposal identifications.
False Negative	DoD- An analyte incorrectly reported as absent from the sample, resulting in potential risks from their presence.
False Positive	DoD- An item incorrectly identified as present in the sample, resulting in a high reporting value for the analyte of concern.
Field Blank	A blank sample prepared in the field by filling a clean container with reagent water and appropriate preservative, if any, for the specific sampling activity being undertaken.
Field Measurement	Determination of physical, biological, or radiological properties, or chemical constituents that are measured on-site, close in time and space to the matrices being sampled/measured, following accepted test methods. This testing is performed in the field outside of a fixed-laboratory or outside of an enclosed structure that meets the requirements of a mobile laboratory.
Field of Accreditation	TNI- Those matrix, technology/method, and analyte combinations for which the accreditation body offers accreditation.

Finding	TNI- An assessment conclusion referenced to a laboratory accreditation standard and supported by objective evidence that identifies a deviation from a laboratory accreditation standard requirement. DoD- An assessment conclusion that identifies a condition having a significant effect on an item or activity. An assessment finding may be positive or negative and is normally accompanied by specific examples of the observed condition. Note: For DoD, the finding must be linked to a specific requirement.
Flame Atomic Absorption Spectrometer (FAA)	Instrumentation used to measure the concentration of metals in an environmental sample based on the fact that ground state metals absorb light at different wavelengths. Metals in a solution are converted to the atomic state by use of a flame.
Flame Ionization Detector (FID)	A type of gas detector used in GC analysis where samples are passed through a flame which ionizes the sample so that various ions can be measured.
Gas Chromatography (GC)	Instrumentation which utilizes a mobile carrier gas to deliver an environmental sample across a stationary phase with the intent to separate compounds out and measure their retention times.
Gas Chromatograph/ Mass Spectrometry (GC/MS)	In conjunction with a GC, this instrumentation utilizes a mass spectrometer which measures fragments of compounds and determines their identity by their fragmentation patterns (mass spectra).
Gasoline Range Organics (GRO)	A range of compounds that denote all the characteristic compounds that make up gasoline (range can be state or program specific).
Graphite Furnace Atomic Absorption Spectrometry (GFAA)	Instrumentation used to measure the concentration of metals in an environmental sample based on the absorption of light at different wavelengths that are characteristic of different analytes.
High Pressure Liquid Chromatography (HPLC)	Instrumentation used to separate, identify and quantitate compounds based on retention times which are dependent on interactions between a mobile phase and a stationary phase.
Holding Time	TNI- The maximum time that can elapse between two specified activities. 40 CFR Part 136- The maximum time that samples may be held prior to preparation and/or analysis as defined by the method and still be considered valid or not compromised. For sample prep purposes, hold times are calculated using the time of the start of the preparation procedure. DoD- The time elapsed from the time of sampling to the time of extraction or analysis, or from extraction to analysis, as appropriate.
Homogeneity	The degree to which a property or substance is uniformly distributed throughout a sample.
Homologue	DoD- One in a series of organic compounds in which each successive member has one more chemical group in its molecule than the next preceding member. For instance, methanol, ethanol, propanol, butanol, etc., form a homologous series.
Inductively Coupled Plasma Atomic Emission Spectrometry (ICP-AES)	Analytical technique used for the detection of trace metals which uses plasma to produce excited atoms that emit radiation of characteristic wavelengths.

Inductively Coupled Plasma- Mass Spectrometry (ICP/MS)	An ICP-AES that is used in conjunction with a mass spectrometer so that the instrument is not only capable of detecting trace amounts of metals and non-metals but is also capable of monitoring isotopic speciation for the ions of choice.
Infrared Spectrometer (IR)	An instrument that uses infrared light to identify compounds of interest.
Initial Calibration (ICAL)	The process of analyzing standards, prepared at specified concentrations, to define the quantitative response relationship of the instrument to the analytes of interest. Initial calibration is performed whenever the results of a calibration verification standard do not conform to the requirements of the method in use or at a frequency specified in the method.
Initial Calibration Blank (ICB)	A blank sample used to monitor the cleanliness of an analytical system at a frequency determined by the analytical method. This blank is specifically run in conjunction with the Initial Calibration Verification (ICV) where applicable.
Initial Calibration Verification (ICV)	DoD- A standard obtained or prepared from a source independent of the source of the standards for the initial calibration. Its concentration should be at or near the middle of the calibration range. It is done after the initial calibration.
Inspection	DoD- An activity such as measuring, examining, testing, or gauging one or more characteristics of an entity and comparing the results with specified requirements in order to establish whether conformance is achieved for each characteristic.
Instrument Blank	DoD- A clean sample (e.g., distilled water) processed through the instrumental steps of the measurement process; used to determine instrument contamination.
Instrument Detection Limits (IDLs)	Limits determined by analyzing a series of reagent blank analyses to obtain a calculated concentration. IDLs are determined by calculating the average of the standard deviations of three runs on three non-consecutive days from the analysis of a reagent blank solution with seven consecutive measurements per day.
Interference, spectral	DoD- Occurs when particulate matter from the atomization scatters incident radiation from the source or when the absorption or emission from an interfering species either overlaps or is so close to the analyte wavelength that resolution becomes impossible.
Interference, chemical	DoD- Results from the various chemical processes that occur during atomization and later the absorption characteristics of the analyte.
Interference Check Sample (ICS)	A series of two solutions, used in ICP and ICPMS analysis, to verify that inter-element interferences are compensated for correctly. This standard is referred to as the Spectra Interference Check (SIC) in EPA Method 200.7 • ICSA – A solution containing only the interfering analytes at high concentrations. • ICSAB – A solution containing interferents plus other method analytes at the level of concern, which corresponds to the project specific action limits. ICSA and ICSAB provide an adequate test of inter-element correction (IEC) factors.
Internal Calibration Model	Internal standard calibration involves the comparison of instrument responses from the target compounds in the sample to the responses of specific internal standard analytes added to the sample or sample extract prior to injection.
Internal Standards	TNI and DoD- A known amount of standard added to a test portion of a sample as a reference for evaluating and controlling the precision and bias of the applied analytical method.
Intermediate Standard Solution	Reference solutions prepared by dilution of the stock solutions with an appropriate solvent.

International System of Units (SI)	DoD- The coherent system of units adopted and recommended by the General Conference on Weights and Measures.
Ion Chromatography (IC)	Instrumentation or process that allows the separation of ions and molecules based on the charge properties of the molecules.
Isomer	DoD- One of two or more compounds, radicals, or ions that contain the same number of atoms of the same element but differ in structural arrangement and properties. For example, hexane (C6H14) could be n-hexane, 2-methylpentane, 3-methylpentane, 2,3-dimethylbutane, 2,2-dimethylbutane.
Laboratory	DoD- A body that calibrates and/or tests.
Laboratory Control Sample (LCS)	TNI and DoD- (however named, such as laboratory fortified blank, spiked blank, or QC check sample): A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes and taken through all sample preparation and analytical steps of the procedure unless otherwise noted in a reference method. It is generally used to establish intra-laboratory or analyst-specific precision and bias or to evaluate the performance of all or a portion of the measurement system.
Laboratory Duplicate	DoD- Aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently.
Laboratory Information Management System (LIMS)	A computer system that is used to maintain all sample information from sample receipt, through preparation and analysis and including sample report generation.
Legal Chain-of-Custody Protocols	TNI- Procedures employed to record the possession of samples from the time of sampling through the retention time specified by the customer or program. These procedures are performed at the special request of the customer and include the use of a Chain-of-Custody Form that documents the collection, transport, and receipt of compliance samples by the laboratory. In addition, these protocols document all handling of the samples within the laboratory.
Limit(s) of Detection (LOD)	TNI- A laboratory's estimate of the minimum amount of an analyte in a given matrix that an analytical process can reliably detect in their facility. DoD- The smallest amount or concentration of a substance that must be present in a sample in order to be detected at a high level of confidence (99%). At the LOD, the false negative rate is 1%.
Limit(s) of Quantitation (LOQ)	TNI- The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. DoD- The lowest concentration that produces a quantitative result within specified limits of precision and bias. For DoD projects, the LOQ shall be set at or above the concentration of the lowest initial calibration standard.
Lot	A quantity of bulk material of similar composition processed or manufactured at the same time.
Management	DoD- Those individuals directly responsible and accountable for planning, implementing, and assessing work.
Management System	DoD- System to establish policy and objectives and to achieve those objectives.
Manager (however named)	DoD- The individual designated as being responsible for the overall operation, all personnel, and the physical plant of the environmental laboratory. A supervisor may report to the manager. In some cases, the supervisor and the manager may be the same individual.

Matrix	TNI and DoD- The substrate of a test sample. For information is provided in the definition of Quality System Matrix below.
Matrix Duplicate	TNI- A replicate matrix prepared in the laboratory and analyzed to obtain a measure of precision.
Matrix Spike (MS) (spiked sample or fortified sample)	TNI- A sample prepared, taken through all sample preparation and analytical steps of the procedure unless otherwise noted in a referenced method, by adding a known amount of target analyte to a specified amount of sample for which an independent test result of target analyte concentration is available. Matrix spikes are used, for example, to determine the effect of the matrix on a method's recovery efficiency. DoD- A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. Matrix spikes are used, for example, to determine the effect of the matrix on a method's recovery efficiency.
Matrix Spike Duplicate (MSD) (spiked sample or fortified sample duplicate)	TNI and DoD- A replicate matrix spike prepared in the laboratory and analyzed to obtain a measure of the precision of the recovery for each analyte.
Measurement System	TNI and DoD- A test method, as implemented at a particular laboratory, and which includes the equipment used to perform the test and the operator(s).
Method	TNI- A body of procedures and techniques for performing an activity (e.g., sampling, chemical analysis, quantification), systematically presented in the order in which they are to be executed.
Method Blank	TNI and DoD- A sample of a matrix similar to the batch of associated samples (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences are present at concentrations that impact the analytical results for sample analyses.
Method Detection Limit (MDL)	DoD- One way to establish a Detection Limit; defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte.
Method Quantitation Limit (MQL)	TX TRRP - The lowest non-zero concentration standard in the laboratory's initial calibration curve and is based on the final volume of extract (or sample) used by the laboratory.
Method of Standard Additions	DoD- A set of procedures adding one or more increments of a standard solution to sample aliquots of the same size in order to overcome inherent matrix effects. The procedures encompass the extrapolation back to obtain the sample concentration.
MintMiner	Software used to review large amounts of chromatographic data to monitor for errors or data integrity issues.
Mobile Laboratory	TNI- A portable enclosed structure with necessary and appropriate accommodation and environmental conditions for a laboratory, within which testing is performed by analysts. Examples include but are not limited to trailers, vans, and skid-mounted structures configured to house testing equipment and personnel.
National Institute of Standards and Technology (NIST)	TNI- A federal agency of the US Department of Commerce's Technology Administration that is designed as the United States national metrology institute (or NMI).

National Pollutant Discharge Elimination System (NPDES)	A permit program that controls water pollution by regulating point sources that discharge pollutants into U.S. waters.
Negative Control	DoD- Measures taken to ensure that a test, its components, or the environment do not cause undesired effects, or produce incorrect test results.
Nitrogen Phosphorus Detector (NPD)	A detector used in GC analyses that utilizes thermal energy to ionize an analyte. With this detector, nitrogen and phosphorus can be selectively detected with a higher sensitivity than carbon.
Nonconformance	DoD- An indication or judgment that a product or service has not met the requirement of the relevant specifications, contract, or regulation; also the state of failing to meet the requirements.
Not Detected (ND)	The result reported for a compound when the detected amount of that compound is less than the method reporting limit.
Percent Recovery	A comparison between the observed value and the true value of a known spiked concentration, represented as a percentage. This evaluation applies to the calculation of ICV, CCV, LCS, MS/MSD, Surrogates, etc.
Performance Audit	DoD- The routine comparison of independently obtained qualitative and quantitative measurement system data with routinely obtained data in order to evaluate the proficiency of an analyst or laboratory.
Performance Based Measurement System (PBMS)	An analytical system wherein the data quality needs, mandates or limitations of a program or project are specified and serve as criteria for selecting appropriate test methods to meet those needs in a cost-effective manner.
Photo-ionization Detector (PID)	An ion detector which uses high-energy photons, typically in the ultraviolet range, to break molecules into positively charged ions.
Polychlorinated Biphenyls (PCB)	A class of organic compounds that were used as coolants and insulating fluids for transformers and capacitors. The production of these compounds was banned in the 1970's due to their high toxicity.
Positive Control	DoD- Measures taken to ensure that a test and/or its components are working properly and producing correct or expected results from positive test subjects.
Post-Digestion Spike	A sample prepared for metals analyses that has analytes spike added to determine if matrix effects may be a factor in the results.
Power of Hydrogen (pH)	The measure of acidity or alkalinity of a solution.
Practical Detection Limit (PDL)	Another term for method detection limit (MDL) or limit of detection (LOD). However, a PDL might not be statically derived and could be set using an in-house protocol.
Practical Quantitation Limit (PQL)	Another term for a method reporting limit or limit of quantitation (LOQ). The lowest reportable concentration of a compound based on parameters set up in an analytical method and the laboratory's ability to reproduce those conditions.
Precision	TNI and DoD- The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves; a data quality indicator. Precision is usually expressed as standard deviation, variance or range, in either absolute or relative terms.
Preservation	TNI- Any conditions under which a sample must be kept in order to maintain chemical and/or biological integrity prior to analysis. DoD- Refrigeration and/or reagents added at the time of sample collection (or later) to maintain the chemical and/or biological integrity of the sample.

Procedure	TNI- A specified way to carry out an activity or process. Procedures can be documented or not.
Proficiency Testing	TNI and DoD- A means of evaluating a laboratory's performance under controlled conditions relative to a given set of criteria through analysis of unknown samples provided by an external source.
Proficiency Testing Program	TNI and DoD- The aggregate of providing rigorously controlled and standardized environmental samples to a laboratory for analysis, reporting of results, statistical evaluation of the results and the collective demographics and results summary of all participating laboratories.
Proficiency Testing Sample (PT)	TNI- A sample, the composition of which is unknown to the laboratory and is provided to test whether the laboratory can produce analytical results within the specified acceptance criteria. DoD- A sample, the composition of which is unknown to the analyst and is provided to test whether the analyst/laboratory can produce analytical results within specified acceptance criteria.
Protocol	TNI and DoD- A detailed written procedure for field and/or laboratory operation (e.g., sampling, analysis) that must be strictly followed.
Quality Assurance (QA)	TNI- An integrated system of management activities involving planning, implementation, assessment, reporting and quality improvement to ensure that a process, item, or service is of the type and quality needed and expected by the customer. DoD- An integrated system of activities involving planning, quality control, quality assessment, reporting, and quality improvement to ensure that a product or service meets defined standards of quality with a stated level of confidence.
Quality Assurance Manual (QAM)	A document stating the management policies, objectives, principles, organizational structure and authority, responsibilities, accountability, and implementation of an agency, organization, or laboratory, to ensure the quality of its product and the utility of its product to its users.
Quality Assurance Project Plan (QAPP)	DoD- A formal document describing the detailed quality control procedures by which the quality requirements defined for the data and decisions pertaining to a specific project are to be achieved.
Quality Control (QC)	TNI- The overall system of technical activities that measures the attributes and performance of a process, item, or service against defined standards to verify that they meet the stated requirements established by the customer; operational techniques and activities that are used to fulfill requirements for quality; also the system of activities and checks used to ensure that measurement systems are maintained within prescribed limits, providing protection against "out of control" conditions and ensuring that the results are of acceptable quality. DoD- The overall system of technical activities whose purpose is to measure and control the quality of a product or service so that it meets the needs of the users.
Quality Control Sample (QCS)	TNI- A sample used to assess the performance of all or a portion of the measurement system. One of any number of samples, such as Certified Reference Materials, a quality system matrix fortified by spiking, or actual samples fortified by spiking, intended to demonstrate that a measurement system or activity is in control. DoD- A sample used to assess the performance of all or a portion of the measurement system. One of any number of samples, such as Certified Reference Materials, a quality system matrix fortified by spiking, or actual samples fortified by spiking.

Quality Manual	TNI and DoD- A document stating the management policies, objectives, principles, organizational structure and authority, responsibilities, accountability, and implementation of an agency, organization, or laboratory, to ensure the quality of its product and the utility of its product to its users.
Quality System	TNI and DoD- A structured and documented management system describing the policies, objectives, principles, organizational authority, responsibilities, accountability, and implementation plan of an organization for ensuring quality in its work processes, products (items), and services. The quality system provides the framework for planning, implementing, and assessing work performed by the organization and for carrying out required quality assurance and quality control activities.
Quality System Matrix	TNI and DoD- These matrix definitions are to be used for purposes of batch and quality control requirements: • **Air and Emissions**: Whole gas or vapor samples including those contained in flexible or rigid wall containers and the extracted concentrated analytes of interest from a gas or vapor that are collected with a sorbant tube, impinger solution, filter, or other device • **Aqueous**: Any aqueous sample excluded from the definition of Drinking Water or Saline/Estuarine. Includes surface water, groundwater effluents, and TCLP or other extracts. • **Biological Tissue**: Any sample of a biological origin such as fish tissue, shellfish or plant material. Such samples shall be grouped according to origin. • **Chemical Waste**: A product or by-product of an industrial process that results in a matrix not previously defined. • **Drinking Water**: Any aqueous sample that has been designated a potable or potentially potable water source. • **Non-aqueous liquid**: Any organic liquid with <15% settleable solids • **Saline/Estuarine**: Any aqueous sample from an ocean or estuary, or other salt water source such as the Great Salt Lake. • **Solids**: Includes soils, sediments, sludges, and other matrices with >15% settleable solids.
Quantitation Range	DoD- The range of values in a calibration curve between the LOQ and the highest successively analyzed initial calibration standard. The quantitation range lies within the calibration range.
Random Error	The EPA has established that there is a 5% probability that the results obtained for any one analyte will exceed the control limits established for the test due to random error. As the number of compounds measured increases in a given sample, the probability for statistical error also increases.

Raw Data	TNI- The documentation generated during sampling and analysis. This documentation includes, but is not limited to, field notes, electronic data, magnetic tapes, untabulated sample results, QC sample results, print outs of chromatograms, instrument outputs, and handwritten records. DoD- Any original factual information from a measurement activity or study recorded in a laboratory notebook, worksheets, records, memoranda, notes, or exact copies thereof that are necessary for the reconstruction and evaluation of the report of the activity or study. Raw data may include photography, microfilm or microfiche copies, computer printouts, magnetic media, including dictated observations, and recorded data from automated instruments. If exact copies of raw data have been prepared (e.g., tapes which have been transcribed verbatim, data and verified accurate by signature), the exact copy or exact transcript may be submitted.
Reagent Blank (method reagent blank)	DoD- A sample consisting of reagent(s), without the target analyte or sample matrix, introduced into the analytical procedure at the appropriate point and carried through all subsequent steps to determine the contribution of the reagents and of the involved analytical steps.
Reagent Grade	Analytical reagent (AR) grade, ACS reagent grade, and reagent grade are synonymous terms for reagents that conform to the current specifications of the Committee on Analytical Reagents of the American Chemical Society.
Reference Material	TNI- Material or substance one or more of whose property values are sufficiently homogenized and well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials. DoD- A material or substance one or more properties of which are sufficiently well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials.
Reference Standard	TNI- Standard used for the calibration of working measurement standards in a given organization or at a given location. DoD- A standard, generally of the highest metrological quality available at a given location, from which measurements made at that location are derived.
Reference Toxicant	DoD- The toxicant used in performing toxicity tests to indicate the sensitivity of a test organism and to demonstrate the laboratory's ability to perform the test correctly and obtain consistent results.
Relative Percent Difference (RPD)	A measure of precision defined as the difference between two measurements divided by the average concentration of the two measurements.
Replicate Sample	The analytical measurement of a sample that has been split after it has been processed through the preparation stage. A replicate can also originate from a single sample that has been sub-sampled two or more times during the same analytical process time.
Reporting Limit (RL)	The level at which method, permit, regulatory and customer-specific objectives are met. The reporting limit may never be lower than the Limit of Detection (i.e. statistically determined MDL). Reporting limits are corrected for sample amounts, including the dry weight of solids, unless otherwise specified. There must be a sufficient buffer between the Reporting Limit and the MDL. DoD- A customer-specified lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

Reporting Limit Verification Standard (or otherwise named)	A standard analyzed at the reporting limit for an analysis to verify the laboratory's ability to report to that level.
Representativeness	A quality element related to the ability to collect a sample reflecting the characteristics of the part of the environment to be assessed. Sample representativeness is dependent on the sampling techniques specified in the project work plan.
Requirement	DoD- Denotes a mandatory specification; often designated by the term "shall".
Response Factor (RF)	A measure of the relative response area of an analyte compared to its internal standard. The response factor is determined by the equation below, and if the calculated value meets the method guidelines it can be used to determine concentration for organic analyses.
Retention Time	DoD- The time between sample injection and the appearance of a solute peak at the detector.
Sample	DoD- Portion of material collected for analysis, identified by a single, unique alphanumeric code. A sample may consist of portions in multiple containers, if a single sample is submitted for multiple or repetitive analysis.
Sample Blank (or Turbidity Blank)	The purpose of a sample blank is to account for spectrophotometric interferences such as sample color, cloudiness, viscosity, etc. The sample blank must be analyzed at the same dilution as the sample. The sample blank is analyzed without any addition of reagents.
Sample Delivery Group (SDG)	A unit within a single project that is used to identify a group of samples for delivery. An SDG is a group of 20 or fewer field samples within a project, received over a period of up to 14 calendar days. Data from all samples in an SDG are reported concurrently.
Sample Detection Limit (SDL)	TX TRRP – The Method Detection Limit (MDL) adjusted to reflect sample-specific actions, such as dilution or use of smaller aliquot sizes than prescribed in the analytical method, and takes into account sample characteristics, sample preparation, and analytical adjustments. The term is analogous to the sample-specific detection limit.
Sample Tracking	Procedures employed to record the possession of the samples from the time of sampling until analysis, reporting and archiving. These procedures include the use of a Chain of custody Form that documents the collection, transport, and receipt of compliance samples to the laboratory. In addition, access to the laboratory is limited and controlled to protect the integrity of the samples.
Sampling	TNI- Activity related to obtaining a representative sample of the object of conformity assessment, according to a procedure.
Secondary Source Calibration Verification (SSCV)	A mid-point or low standard made from the secondary source (lot or manufacturer) that is not used to construct the calibration curve. The SSCV is used to represent the calibration accuracy of the instrument and must perform within method stated guidelines. This sample is used to document calibration accuracy. The SSCV can be the same solution as the LCS, but is analyzed as an instrument standard, rather than a method prepared standard.
Selective Ion Monitoring (SIM)	A mode of analysis in mass spectrometry where the detector is set to scan over a very small mass range, typically one mass unit. The narrower the range, the more sensitive the detector.

Selectivity	TNI- The ability to analyze, distinguish, and determine a specific analyte or parameter from another component that may be a potential interferent or that may behave similarly to the target analyte or parameter within the measurement system. DoD- The capability of a test method or instrument to respond to a target substance or constituent in the presence of non-target substances.
Sensitivity	TNI and DoD- The capability of a method or instrument to discriminate between measurement responses representing different levels (e.g., concentrations) of a variable of interest.
Serial Dilution	The stepwise dilution of a substance in a solution.
Shall	Denotes a requirement that is mandatory whenever the criterion for conformance with the specification requires that there be no deviation. This does not prohibit the use of alternative approaches or methods for implementing the specification as long as the requirement is fulfilled.
Should	Denotes a guideline or recommendation whenever noncompliance with the specification is permissible.
Signal-to-Noise Ratio	DoD- The signal carries information about the analyte, while noise is made up of extraneous information that is unwanted because it degrades the accuracy and precision of an analysis and also places a lower limit on the amount of analyte that can be detected. In most measurements, the average strength of the noise is constant and independent of the magnitude of the signal. Thus, the effect of noise on the relative error of a measurement becomes greater and greater as the quantity being measured (producing the signal) decreases in magnitude.
Spike	DoD- A known mass of target analyte added to a blank sample or sub-sample; used to determine recovery efficiency or for other quality control purposes.
Standard (Document)	TNI and DoD- The document describing the elements of a laboratory accreditation that has been developed and established within the consensus principles of standard setting and meets the approval requirements of standard adoption organizations procedures and policies.
Standard (Chemical)	DoD- Standard samples are comprised of a known amount of standard reference material in the matrix undergoing analysis. A standard reference material is a certified reference material produced by US NIST and characterized for absolute content, independent of analytical test method.
Standard Blank (or Reagent Blank)	A calibration standard consisting of the same solvent/reagent matrix used to prepare the calibration standards without the analytes. It is used to construct the calibration curve by establishing instrument background.
Standard Method	DoD- A test method issued by an organization generally recognized as competent to do so.
Standard Operating Procedure (SOP)	TNI- A written document that details the method for an operation, analysis, or action with thoroughly prescribed techniques and steps. SOPs are officially approved as the methods for performing certain routine or repetitive tasks. DoD- A written document which details the method of an operation, analysis or action whose techniques and procedures are thoroughly prescribed and which is accepted as the method for performing certain routine or repetitive tasks.
Standard Reference Material (SRM)	DoD- A certified reference material produced by the US NIST or other equivalent organization and characterized for absolute content, independent of analytical method.
Statement of Qualifications (SOQ)	A document that lists information about a company, typically the qualifications of that company to compete on a bid for services.

Stock Standard	A concentrated reference solution containing one or more analytes prepared in the laboratory using an assayed reference compound or purchased from a reputable commercial source.
Supervisor	DoD- The individual(s) designated as being responsible for a particular area or category of scientific analysis. This responsibility includes direct day-to-day supervision of technical employees, supply and instrument adequacy and upkeep, quality assurance/quality control duties and ascertaining that technical employees have the required balance of education, training and experience to perform the required analyses.
Surrogate	DoD- A substance with properties that mimic the analyte of interest. It is unlikely to be found in environmental samples and is added to them for quality control purposes.
SUMMA Canister	A SUMMA canister is a stainless steel electropolished (or "SUMMA" polished) that enriches the nickel and chromium surface and makes it more inert than untreated stainless steel. These canisters are used to collect air or vapor samples.
Systems Audit	An on-site inspection or assessment of a laboratory's quality system.
Target Analytes	DoD- Analytes specifically named by a customer (also called project-specific analytes).
Technical Director	DoD- Individual(s) who has overall responsibility for the technical operation of the environmental testing laboratory.
Technology	TNI- A specific arrangement of analytical instruments, detection systems, and/or preparation techniques.
Tedlar Bags	Bags made from polyvinyl fluoride (PVF) film that are used to collect air or vapor samples.
Tentatively Identified Compound (TIC)	Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates. TICs can be tentatively identified using mass spectrometers in spectral comparisons with NBS library searches. Quantitation of TICs provides a rough approximation of the concentration of these non-target analytes.
Test	DoD- A technical operation that consists of the determination of one or more characteristics or performance of a given product, material, equipment, organism, physical phenomenon, process or service according to a specified procedure. The result of a test is normally recorded in a document sometimes called a test report or a test certificate.
Test Method	DoD- An adoption of a scientific technique for performing a specific measurement as documented in a laboratory SOP or as published by a recognized authority.
Test Methods for Evaluating Solid Waste, Physical/ Chemical (SW-846)	EPA Waste's official compendium of analytical and sampling methods that have been evaluated and approved for use in complying with RCRA regulations.
Total Petroleum Hydrocarbons (TPH)	A term used to denote a large family of several hundred chemical compounds that originate from crude oil. Compounds may include gasoline components, jet fuel, volatile organics, etc.
Toxicity Characteristic Leaching Procedure (TCLP)	A solid sample extraction method for chemical analysis employed as an analytical method to simulate leaching of compounds through a landfill.

Traceability	TNI- The ability to trace the history, application, or location of an entity by means of recorded identifications. In a calibration sense, traceability relates measuring equipment to national or international standards, primary standards, basic physical conditions or properties, or reference materials. In a data collection sense, it relates calculations and data generated throughout the project back to the requirements for the quality of the project. DoD- The property of a result of a measurement whereby it can be related to appropriate standards, generally international or national standards, through an unbroken chain of comparisons.
Training Document	A training resource that provides detailed instructions to execute a specific method or job function.
Trip Blank	This blank sample is used to detect sample contamination from the container and preservative during transport and storage of the sample. A cleaned sample container is filled with laboratory reagent water and the blank is stored, shipped, and analyzed with its associated samples.
Tuning	DoD- A check and/or adjustment of instrument performance for mass spectrometry as required by the method.
Ultraviolet Spectrophotometer (UV)	Instrument routinely used in quantitative determination of solutions of transition metal ions and highly conjugated organic compounds.
Unadjusted Method Quantitation Limit (Unadj. MQL)	TX TRRP – The Method Quantitation Limit (MQL) that has not been adjusted based on sample specific actions such as dilution.
Uncertainty Measurement	The parameter associated with the result of a measurement that characterized the dispersion of the values that could be reasonably attributed to the measurand (i.e. the concentration of an analyte).
Validation	DoD- The confirmation by examination and provision of objective evidence that the particular requirements for a specific intended use are fulfilled.
Verification	TNI and DoD- Confirmation by examination and objective evidence that specified requirements have been met. Note: In connection with the management of measuring equipment, verification provides a means for checking that the deviations between values indicated by a measuring instrument and corresponding known values of a measured quantity are consistently smaller than the maximum allowable error defined in a standard, regulation or specification peculiar to the management of the measuring equipment. The result of verification leads to a decision either to restore in service, to perform adjustment, to repair, to downgrade, or to declare obsolete. In all cases, it is required that a written trace of the verification performed shall be kept on the measuring instrument's individual record.
Whole Effluent Toxicity (WET)	The aggregate toxic effect to aquatic organisms from all pollutants contained in a facility's wastewater (effluent).

SOP	*STANDARD OPERATING PROCEDURE*
SRM	*STANDARD REFERENCE MATERIAL*
SURR	*SURROGATE*
SVOC	*SEMI-VOLATILE ORGANIC COMPOUND*
TNI	*THE NELAC INSTITUTE*
UV	*ULTRAVIOLET*
VOC	*VOLATILE ORGANIC COMPOUND*

4.0 MANAGEMENT REQUIREMENTS

4.1 ORGANIZATION

4.1.1 Legal identity

The laboratory is authorized under Title 62 of the Tennessee Code Annotated and is identified as Environmental Science Corporation (d.b.a. ESC Lab Sciences) located at 12065 Lebanon Road, Mount Juliet, TN 37122

4.1.2 Organization

The laboratory is a public entity and is structured to provide environmental support services in compliance with numerous federal, state, and local regulations as well as to meet the analytical needs of the customer.

4.1.3 Facilities Under Management System

The scope of the ESC management system is comprehensive and covers all technical and supporting work conducted at all facilities including the primary Lebanon Road location as well as customer support and shipping operations across the US.

4.1.4 Independence

ESC Lab Sciences is an independent analytical facility, and is not a part of another organization.

4.1.5 Laboratory Managerial Polices

ESC Lab Sciences must have the following:

- Managerial and technical personnel have the authority and resources needed to carry out their duties. Management bears the specific responsibility for the implementation, maintenance, and improvement of the laboratory's management system. This includes the identification of any departures from the management system or standard operating procedures, and to initiate actions to prevent or minimize such departures.
- Management and personnel that are free from any undue pressures and influences that may adversely affect the quality of their work. The organizational structure indicated in this section is designed to minimize the potential for conflicts or undue stresses that might influence the technical judgment of analytical personnel. Analytical personnel are generally isolated from customer contact as much as practical. In addition, the laboratory workload is continually reviewed and managed in such a way as to reduce the potential for undue production pressure on analytical personnel.

- Policies and procedures to ensure the protection of its customers' confidentiality. The laboratory's confidentiality policy is to not divulge or release any information to a third party without proper written authorization. All information pertaining to a particular customer will remain confidential. Data will be released to outside agencies only with written authorization from the customer or where federal or state law requires the laboratory to do so. Samples are generally identified with laboratory identification numbers, and access to electronic records and reports is password protected. Confidentiality statements are applied to fax and e-mail communications. All personnel, including contract and temporary, are required to sign an "Attestation of Ethics and Confidentiality" at the time of employment and during annual refresher training. Violations of this document result in serious consequences, including prosecution and termination, if necessary. For more information see the ESC Policy Manual and SOP #010102, *Ethics, Data Integrity, and Confidentiality*.
- Policies and procedures to avoid involvement in any activities that would diminish confidence in its competence, impartiality, judgment or operational integrity. For more information see the ESC Policy Manual and SOP #010102, Ethics, Data Integrity, and Confidentiality. The laboratory's data integrity system is also discussed in Section 4.2.8 below.
- A defined organization and management structure. The laboratory's organizational chart can be found at the end of this section.
- Specifications of the responsibility, authority, and interrelationships of all personnel who manage, perform, or verify work affecting the quality of the analytical results. Job descriptions are documented and maintained by the Human Resources department. It is the laboratory's policy that each individual understands his or her particular responsibilities and how to report problems when they occur.
- Adequate supervision provided to all analytical staff, including trainees, by persons familiar with the analytical methods and procedures.
- Technical management which has overall responsibility for the technical operations. This includes providing the resources needed to ensure the required quality of laboratory operations is met as per the policies and procedures documented in this Quality Assurance Manual. This technical management includes the Chief Executive Officer, the President, the Director of Operations, the Organics Manager, the Inorganics Manager, and each individual department supervisor.
- Quality management which has the responsibility and authority for ensuring that the management system related to quality is implemented and followed at all times. Currently the Compliance Director and the Quality Assurance Director have been appointed for this task. These staff members have direct

access to the highest level of management at which decisions are made on laboratory policy and resources.

- Appointed deputies for key managerial personnel. The following table defines who assumes the responsibilities of key personnel in their absence:

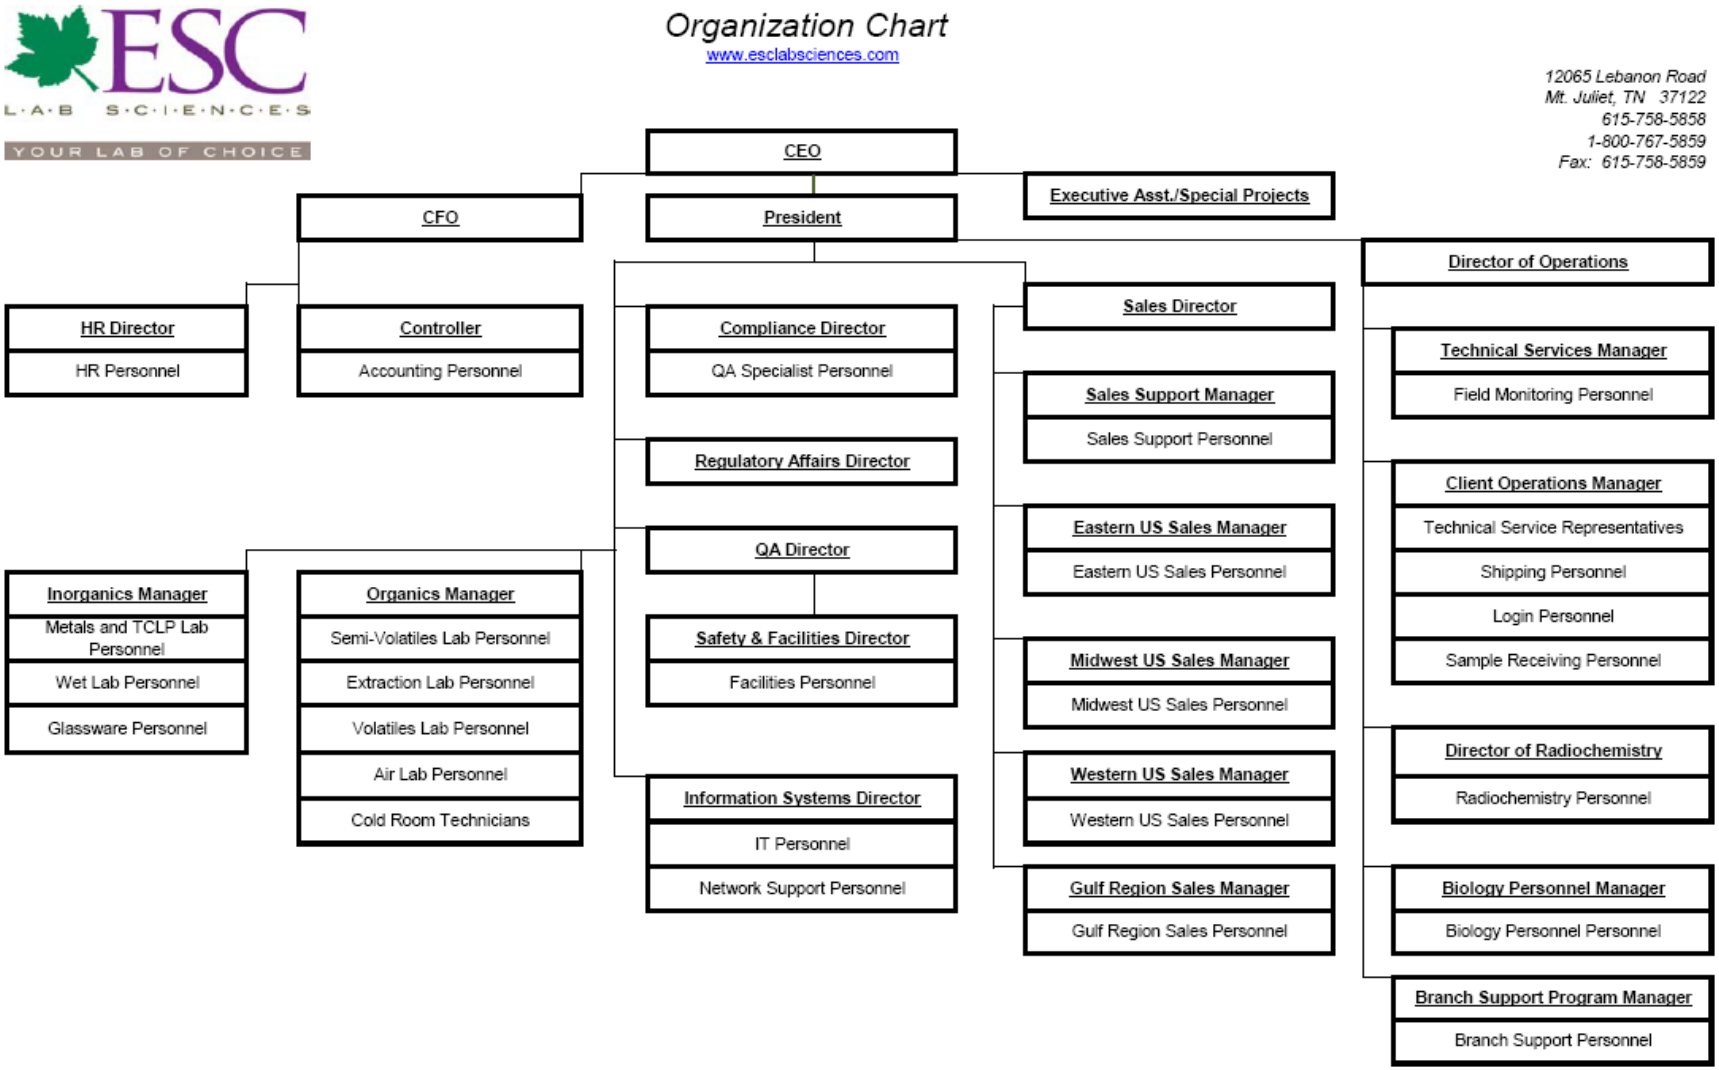
PRIMARY	DEPUTY
Chief Executive Officer	President
President	Chief Executive Officer
Director of Operations	Technical Services Manager
Organics Manager	President and Department Supervisors/Leads
Inorganics Manager	President and Department Supervisors/Leads
Compliance Director	Quality Assurance Director
Quality Assurance Director	Compliance Director
Information Systems Director	Ad Hoc (Applicable IT personnel as needed)

- Personnel that are aware of the relevance and importance of their activities and how they contribute to the achievement of the objectives of the management system. Laboratory management ensures that all personnel are aware that their job is needed, and how each role contributes to the laboratory's business goals. All personnel are required to familiarize themselves with the quality documentation relevant to their position and implement these policies and procedures in their work. All personnel must ensure that the generation and reporting of quality analytical data is a fundamental priority.

4.1.6 Laboratory Communication

Laboratory management ensures that appropriate communication processes are established within the laboratory and that communication takes place regarding the effectiveness of the management system. Laboratory personnel (including supervisors and managers) communicate as needed through meetings, memos, and/or e-mails.

Figure 4.1 Organizational Chart (*Subject to change*)



4.2 Management System

4.2.1 General

ESC Lab Sciences has established, implemented, and maintains a management system appropriate to the scope of its activities. ESC Lab Sciences has documented its policies and procedures to the extent necessary to assure the quality of the analytical test results. The ESC Lab Sciences management system's documentation is communicated to, understood by, available to, and implemented by the appropriate laboratory personnel.

4.2.2 Management's Quality Policy Statement

ESC Lab Sciences has a diverse accreditation/certification program which represents greater than 48 separate state and national accreditations. This requires commitment to the laboratory's quality system, and it also requires continuous improvement to comply with all the applicable state, federal, and industry standards. ISO 17025 is maintained as the minimum foundation to meet each program requirement.

ESC Lab Sciences management is committed to providing our customers reliable data of known quality that meets their requirements by following the quality system that is documented in this Quality Assurance Manual. Management is committed to using good professional practices and demonstrates its commitment to quality by providing the personnel, equipment, and facilities necessary to ensure the laboratory gives our customers the highest possible standard of service.

The primary responsibility for quality rests with each individual within ESC Lab Sciences. All personnel are required to familiarize themselves with the quality documentation relevant to their position and implement these policies and procedures in their work. All personnel must ensure that the generation and reporting of quality analytical data is a fundamental priority. This focus on quality is applied to initial project planning, continued through all field and laboratory activities, and is ultimately included in the final report generation.

4.2.3 Management's Commitment to the Management System

ESC's management is committed to the development, implementation, and continual improvement of the laboratory's management system. Evidence of this commitment can be found in the policies and procedures that are included in this Quality Assurance Manual which includes, but is not limited to, records of management review meetings as per section 4.15 below.

4.2.4 Communication of Customer and Regulatory Requirements

ESC's management communicates to the organization the importance of meeting

customer and regulatory requirements. This is accomplished in writing through this Quality Assurance Manual, ESC's Policy Manual, and through ESC's Standard Operating Procedures. This is also accomplished verbally through staff meetings.

4.2.5 Supporting and Technical Procedures

The full list of supporting and technical procedures used by the laboratory is maintained by the Quality Assurance Department. This list can be provided upon request. This Quality Assurance Manual contains references to these procedures where applicable, and outlines the structure of the documentation used in the laboratory's management system.

4.2.6 Management Roles and Responsibilities

The roles and responsibilities of some technical and quality management are defined below. More information can be found in the job descriptions that are maintained by the Human Resources department. All managers and supervisors are responsible to ensure that their respective departments comply with all the applicable state, federal, and industry standards.

Chief Executive Officer

Peter Schulert, Bachelor of Science in Chemistry, is the laboratory's Chief Executive Officer (CEO). He joined ESC in 1987 after the completion of his service with the United States Naval Submarine Service. In his five years of nuclear submarine experience in the Navy, Mr. Schulert qualified as an Officer of the Deck. This qualification included supervision of nuclear reactors and power plant operations. His vision for automation and customer services has been a key component of ESC's rise to the top ranks of the industry. Under his leadership, ESC has become a large single location laboratory, with a comprehensive national certification program and industry leading data management tools. In his absence, all responsibilities are delegated to the ESC President.

President

John Mitchell, Bachelor of Science in Chemistry, is the laboratory's President. He joined ESC in 2014 after gaining over 25 years of experience in commercial laboratory operations and management. He has served as a National Program Director for Oil and Gas Programs for several years, assisting exploration and production industrial customers with the establishment and management of risk-based analytical programs to ensure compliance with regulatory requirements and to develop additional strategies to reduce long term environmental impact liability. He directed emergency response actions, leading the laboratory response for multiple large scale mobilizations across the country. Mr. Mitchell is responsible for developing and executing ESC's strategic plan. In his absence, all operational responsibilities are delegated to the Chief Executive Officer.

Director of Operations

Eric Johnson, B.S. in Chemistry, is the laboratory's Director of Operations and is primarily responsible for the Project Management, Branch Support, Shipping, and Receiving departments. He has been involved in many aspects of environmental analyses since 1991, and has vast experience in managing the daily laboratory and customer service operations of ESC Lab Sciences. He focuses his background and experience on the improvement of existing systems in order to improve quality and maximize efficiency. He reports directly to the President. In his absence, his responsibilities are delegated to the Technical Services Manager and then to individual department managers.

Organics Manager

Chris Johnson, B.S. in Biology, is the Organics Manager. He has more than 15 years of laboratory experience which includes supervising laboratory personnel and also performing analyses for metals, volatile organic compounds, and semi-volatile organic compounds in support of the Safe Drinking Water Act, Clean Water Act, Resource Conservation and Recovery Act, and numerous other state and regulatory programs. His responsibilities are to share the vision and direction of laboratory management with the organic departments, effectively communicate with laboratory management and to personnel within the organic departments, to develop goals within the organic departments, to provide the information and resources necessary to reach each goal, and for ensuring the organic departments are providing accurate analytical data in the most efficient manner possible within regulatory guidelines. He is also responsible for the research, evaluation, implementation, and validation of new instrumentation and methodologies. In his absence, his responsibilities are delegated to the President then to individual department supervisors and/or leads.

Inorganics Manager

Johnny Davis, B.S. in Biology, is the Inorganics Manager. He has 13 years of laboratory experience which includes supervising laboratory personnel and also performing analyses for metals and semi-volatile organic compounds in support of the Safe Drinking Water Act, Clean Water Act, Resource Conservation and Recovery Act, and numerous other state and regulatory programs. His responsibilities are to share the vision and direction of laboratory management with the inorganic departments, effectively communicate with laboratory management and to personnel within the inorganic departments, to develop goals within the inorganic departments, to provide the information and resources necessary to reach each goal, and for ensuring the inorganic departments are providing accurate analytical data in the most efficient manner possible within regulatory guidelines. He is also responsible for the research, evaluation, implementation, and validation of new instrumentation and methodologies. In his absence, his responsibilities are delegated to the President then to individual department supervisors and/or leads.

Compliance Director

Jim Brownfield, B.S. in Chemistry, is the Compliance Director. His primary responsibility is to ensure regulatory compliance of the laboratory. He is also responsible for managing the implementation, monitoring, and development of the laboratory's Quality Assurance Systems; maintaining the laboratory's Quality Assurance Manual; and ensuring all laboratory personnel are strictly adhering to the laboratory's ethics policy. He also performs other Quality Assurance activities including method validation, technical writing, and participation in internal and external assessments. In addition, he oversees the QA data review team. He has more than 15 years of experience in various supervisory and managerial roles in the environmental laboratory industry. Over the years he has gained an extensive and detailed understanding of regulatory and accreditation requirements of federal and various state accreditation agencies. He has successfully designed, developed, implemented, and maintained Quality Assurance Systems in multiple laboratories. In his absence, all responsibilities are delegated to the Quality Assurance Director.

Quality Assurance Director

Steve Miller, B.S. in Microbiology, is the laboratory Quality Assurance Director and is responsible for managing the implementation, monitoring, and development of the laboratory's Quality Assurance Systems. In this role, he also oversees safety, waste management, internal and external audits, and new method implementation. He has been involved in many aspects of the environmental industry since 1990. He has an in-depth knowledge of GC and GCMS methods and instrumentation having hands-on experience with MS, PID/FID, FID, and ECD detectors. He has years of experience validating all types of environmental data. He has served as technical support for many environmental site investigation and/or remediation projects, primary author of several project-specific Quality Assurance Project Plans, support for RCRA-permitted activities at major oil refineries (including permit modification), and primary author of the first hazardous waste delisting petition approved by U.S. EPA Region 8. In his absence, all responsibilities are delegated to the Compliance Director.

Information Systems Director

Nick Parker, B.S. in Plant and Soil Science, is the laboratory's Information Systems Director. He has more than 15 years of laboratory experience in Organic analytical methods/instrumentation in the production laboratory environment and an expertise within information technologies and process automation. Mr. Parker is responsible for ESC's data management, information security, and software development while leading a team of developers, specialists, and Database Administrators. His unique understanding of laboratory operations and environmental methodology contributes to ESC's well managed software development and deployment within all laboratory

and quality departments. In his absence, all responsibilities are delegate to applicable personnel in the IT department.

4.2.7 Management of System Changes

Top management ensures that the integrity of the management system is maintained when changes to the management system are planned and implemented. This includes ensuring that quality system documentation is updated as needed.

4.2.8 Data Integrity System

ESC Lab Sciences is committed to ensuring the integrity of its data and providing valid data of known and documented quality to its customers. ESC is also committed to creating and maintaining a culture of quality throughout the organization. The elements in ESC's data integrity system include:

- A standardized data integrity training program that is given to all new employees and a yearly refresher course is also presented to all employees.
- All ESC personnel, including contract and temporary, are required to sign an "Attestation of Ethics and Confidentiality" at the time of employment and during annual refresher training.
- An in-depth periodic monitoring of data integrity which includes, but is not limited to, the following: peer data review, internal audits, QA data review of raw data, and proficiency testing studies.
- A process that allows for confidential reporting of alleged data integrity issues. Currently, an anonymous hotline is available to all employees that is managed by an outside vendor. Messages are collected, documented, reviewed, and will be followed up on by senior management to resolve the matter. Comments made on this hotline are confidential, and callers will remain anonymous.

Anonymous Hotline Number: 1-800-398-1496

Additional information about the laboratory's data integrity system can be found in SOP# 010102 *Ethics, Data Integrity, and Confidentiality*. This SOP is signed by top management and is reviewed at least annually.

4.2.9 Policy for Use and Control of Electronic Signatures

Electronic signatures must be controlled by the individual as electronic files. Electronic signature files must be stored in a secure password protected environment, and are not sent to or used by other individuals. Electronic signatures carry the same weight as handwritten signatures with regards to document approval.

4.3 DOCUMENT MANAGEMENT

This section describes procedures for document management, which includes controlling, distributing, reviewing, and accepting modifications. The purpose of document management is to ensure that adequate instruction is readily available for laboratory employees and to preclude the use of invalid and/or obsolete documents.

4.3.1 Document Control Procedure

ESC has an established procedure for managing documents that are part of the quality system. The list of managed documents includes, but is not limited to, Standard Operating Procedures (both technical and non-technical), the Quality Assurance Manual, policy statements, work-processing documents, charts, and forms that have a direct bearing on the quality system.

Documents required by the management system are managed per the SOP #010103, *Document Control and Distribution*.

4.3.2 Document Approval and Issue

Documents are reviewed and approved for use by authorized personnel prior to issue. A master list of all managed documents is maintained identifying the current revision status and distribution of the controlled documents. This establishes that there are no invalid or obsolete documents in use.

The SOP #010103, *Document Control and Distribution* ensures:

- Only currently approved document versions are available at points of use
- Documents are reviewed periodically and revised if necessary
- Invalid or obsolete documents are promptly removed from general use
- Obsolete documents retained for audit or knowledge preservation purposes are suitably marked and/or isolated to prevent accidental use

Documents that are generated internally by the laboratory are uniquely identified with the following:

- Date of issue and/or revision identification
- Page numbering
- Total number of pages or a mark to indicate the end of the document
- The issuing authority(ies)

4.3.3 Changes to Controlled Documents

Document changes are reviewed and approved by the original approving authority(ies) unless specifically designated otherwise. Designated authorities are required to have pertinent background information upon which to base their review and approval.

Where practicable, the altered text or new text in the draft is identified during the revision or review process to provide for easy identification of the modifications. Minor SOP changes that occur in the interim of each major revision of the procedure are indicated in the ESC SOP/Minor Revision Form that is attached to the SOP. All SOPs contain a revision history that provides details of changes during periodic reviews and/or major SOP revisions.

The document management process allows for “minor revisions” or amendments to SOPs where changes are not sufficient to cause a full procedure change. Minor revisions may take the form of handwritten or typed notes on an approved SOP Minor Revision form. Approval of these minor revisions are indicated by the initials of the approval authorities. The modified document is then distributed, and obsolete documents are removed. Minor revisions to documents are incorporated into the next full revision as soon as practical.

Electronic documents, such as the Quality Assurance Manual and SOPs, are maintained electronically on protected directories. All laboratory personnel have access to directories that contain the currently approved versions, but edit rights are restricted to authorized personnel only. Obsolete versions of electronic documents are maintained in directories that can only be accessed be authorized personnel.

4.3.4 Quality Assurance Manual

The Compliance Director is responsible for maintaining the currency of the Quality Assurance Manual.

The Quality Assurance Manual is reviewed/revised annually or whenever a change is deemed necessary by laboratory management to ensure it still reflects current practices and meets the requirements of any applicable regulations or customer specifications.

The Quality Assurance Manual contains the following required items as defined by the 2009 TNI Standard (V1:M2, Section 4.2.8.3):

- A document title
- The laboratory's full name and address
- The name, address (if different from above), and telephone number of individual(s) responsible for the laboratory;
- The identification of all major organizational units which are to be covered by this quality manual and the effective date of the version
- Identification of the laboratory's approved signatories;
- The signed and dated concurrence (with appropriate names and titles), of all responsible parties including the quality manager, technical manager(s), and the agent who is in charge of all laboratory activities, such as the laboratory director or laboratory manager.
- The objectives of the management system and contain or reference the laboratory’s policies and procedures
- The laboratory’s official quality policy statement, which shall include management system objectives and management’s commitment to ethical laboratory practices and to upholding the requirements of ISO 17025 and the TNI Standard
- Table of contents, and applicable lists of references, glossaries and appendices.

This Quality Assurance Manual also contains or references the following required items as defined by the 2009 TNI Standard (V1:M2, Section 4.2.8.4):

- All maintenance, calibration and verification procedures used by the laboratory in conducting tests
- Major equipment and reference measurement standards used as well as the facilities and services used by the laboratory in conducting tests
- Verification practices, which may include inter-laboratory comparisons, proficiency testing programs, use of reference materials and internal quality control schemes
- Procedures for reporting analytical results
- The organization and management structure of the laboratory, its place in any parent organization, and relevant organizational charts

- Procedures to ensure that all records required under ISO 17025:2005 and the TNI Standard are retained, as well as procedures for control and maintenance of documentation through a document control system that ensures that all standard operating procedures (SOPs), manuals, or documents clearly indicate the time period during which the procedure or document was in force
- Job descriptions of key staff and reference to the job descriptions of other laboratory staff
- Procedures for achieving traceability of measurements
- A list of all methods under which the laboratory performs its accredited testing
- Procedures for ensuring that the laboratory reviews all new work to ensure that it has the appropriate facilities and resources before commencing such work
- Procedures for handling samples
- Procedures to be followed for feedback and corrective action whenever testing discrepancies are detected, or departures from documented policies and procedures occur
- Policy for permitting departures from documented policies and procedures or from standard specifications
- Procedures for dealing with complaints
- Procedures for protecting confidentiality and proprietary rights
- Procedures for audits and data review
- Procedures for establishing that personnel are adequately experienced in the duties they are expected to carry out and are receiving any needed training;
- Policy addressing the use of unique electronic signatures

4.3.5 Standard Operating Procedures

Standard Operating Procedures (SOPs) are written procedures that describe in detail how to accurately and consistently reproduce laboratory processes or provide additional direction for laboratory personnel. Copies of all SOPs are accessible to all personnel. SOPs consist of three types:

- Technical SOPs, pertaining to a laboratory process which have specifically required details
- Administrative SOPs which document the more general organizational procedures.
- Quality SOPs that provide background and process for quality policy.

Each SOP indicates the effective date, the revision number, and the issuing authority(ies). Department Supervisor approval is required on technical procedures. Detailed information can be found in SOP# 010100, *Writing, Revising, and Maintaining Standard Operating Procedures*

Deviations from SOPs and Quality documents are not allowed without the permission of the Compliance Director, or designee. In the event that a deviation is requested, the circumstance is considered and the procedure is evaluated for necessary change and allowance.

The laboratory has SOPs for all analytical methods within its scope of accreditation. Any deviation from a method is documented in the method modifications section of the respective SOP, including both a description of the change made and a technical justification.

Each determinative method SOP includes or references (as applicable) the following:

- Scope and Application;
- Method Summary and Definitions;
- Health and Safety;
- Sample Preservation, Containers, Handling and Storage;
- Interferences;
- Equipment and Supplies;
- Reagents and Standards;
- Procedure;
- Data Analysis and Calculations;
- Quality Control and Method Performance;
- Data Validation and Corrective Action;
- Pollution Prevention and Waste Management;
- Method Modifications/Clarifications;
- References;
- Procedure Revision/Review History;

SOPs may not be reproduced, in part or in full, without written consent of ESC Lab Sciences. SOPs may not be altered in any way. Whether distributed internally or as a courtesy copy to customers or regulatory agencies, SOPs are considered confidential and proprietary information. Any copies in use within ESC Lab Sciences have been reviewed, approved, and properly controlled. Any copies of SOPs distributed outside of ESC Lab Sciences are uncontrolled, unless a customer or regulator specifically requests a controlled copy.

4.4 REVIEW OF REQUESTS, TENDERS, AND CONTRACTS

4.4.1 Procedure for Requests, Tenders, and Contracts Review

When ESC enters into a contract to provide laboratory services, it follows SOP# 020303, *Contract Review*. Upon receipt of a request or invitation to tender a bid/proposal, the customers' requirements are examined by the contract review personnel to establish that the necessary details are adequately outlined and that the laboratory is able and willing to meet them.

For routine/non-complex projects, a review by appropriate customer service personnel is considered adequate. Customer service confirms that the laboratory can meet the customer's data quality objectives, and the laboratory has any required certifications. Customer service will also confirm that the laboratory has the capacity to meet the customer's turn-around time needs.

4.4.2 Records of Reviews

Records of reviews of requests, tenders and contracts (including significant changes) are maintained. Records are also maintained of pertinent discussions with the customer relating to the customer's requirements and the results of the work during the period of execution of the contract.

4.4.3 Subcontracted Work

The review described above also encompasses any work that will need to be subcontracted to another laboratory. See section 4.5 below for more information about subcontracting work.

4.4.4 Deviations from the Contract

Applicable customers are informed of any deviation from any contract.

4.4.5 Contract Amendments

If a contract requires amendment after work has commenced, the same contract review process is repeated and any amendments are communicated to all affected parties.

4.5 SUBCONTRACTING

4.5.1 Subcontractor Competence

ESC only performs analytical techniques that are within its documented capability, when this is not possible, the laboratory follows SOP# 030209, *Subcontracting.* Subcontracting also occurs in the special circumstances where technical, safety, or efficiency issues dictate need. When subcontracting analytical services, the laboratory assures work requiring specific accreditation is placed with an accredited laboratory or one that meets applicable statutory and regulatory requirements of the project/customer. As part of the subcontractor approval process, a copy of the applicable certificates and scopes for subcontractor's accreditations is maintained as evidence of compliance.

4.5.2 Customer Notification

ESC notifies the customer of the intent to subcontract the work in writing. The laboratory typically gains the approval of the customer to subcontract their work prior to implementation, preferably in writing.

4.5.3 ESC Responsibility

ESC assumes responsibility for the qualifications of the subcontractor except when the customer or an authority specifies the subcontractor.

4.5.4 Subcontractor List

ESC maintains a list of all approved subcontract laboratories.

4.5.5 Identification of Subcontracted Work

All analytical reports, which contain data from subcontracted laboratories, include a statement which references the subcontractor laboratory/service.

4.6 PURCHASING SERVICES AND SUPPLIES

4.6.1 Purchasing Policies and Procedures

ESC maintains SOP# 030210, *Materials Procurement for Analytical Processes*, which describes the purchasing process, including vendor selection and acceptance criteria, for the purchase, storage, and evaluation of supplies and services. When relevant to the measurement integrity of analyses, ESC uses only services and supplies of adequate quality.

4.6.2 Quality of Purchased Items

Department supervisors are responsible for ensuring only supplies/chemicals that meet specified requirements are ordered. Where assurance of the quality of services or supplies is unavailable, the laboratory uses these items only after they have been inspected or otherwise verified for adequate quality. Records of inspections and verifications are maintained in the laboratory.

4.6.3 Purchasing Documents

Purchasing documents are maintained and they contain information that describes the services and supplies that were ordered. These purchasing documents are reviewed and approved by applicable personnel prior to release.

4.6.4 Approved Supplier List

Suppliers of critical services and supplies are evaluated. An approved list of material/service suppliers is maintained where products/services purchased affect the quality of data generated by the laboratory.

4.7 SERVICE TO THE CUSTOMER

ESC's Customer Service Department provides specific project service through the use of Technical Service Representatives (TSRs). The TSR is responsible for all contract requirements and laboratory/customer communication, including information concerning schedules, delays, and major deviations in the testing process.

4.7.1 Meeting Customer Expectations

ESC is willing to cooperate with its customers. The TSR works closely with the customer to clarify the customer's requests and to monitor the laboratory's performance in relation to the work requested, while ensuring confidentiality to other customers. The laboratory confidentiality policy prohibits divulging or releasing any information to a third party without proper authorization. See SOP# 010102, *Ethics, Data Integrity, and Confidentiality.* All electronic data (storage or transmissions) are kept confidential, based on technology and laboratory limitations, as required by customer or regulation. All electronic transmissions contain a confidentiality notice that represents the following:

Notice: This communication and any attached files may contain privileged or other confidential information. If you have received this in error, please contact the sender immediately via reply email and immediately delete the message and any attachments without copying or disclosing the contents. Thank you.

For additional information see SOP# 020301, *TSR (Project Management).*

4.7.2 Customer Feedback

ESC seeks customer feedback (both positive and negative) through various means including surveys and personal communication. This feedback is utilized to improve the management system, quality system, testing and calibration activities and customer services.

4.7.3 Customer Access to the Laboratory

Upon customer request, ESC provides reasonable access to relevant areas of the laboratory for witnessing capability and analytical performance. Confidentiality of all customers during this process is maintained.

4.7.4 Providing Supplemental Information

Upon request customers are provided supplementary information and records as needed. This includes, but is not limited to, the following: sample preparation records, packaging information, verification of calibrations, and analytical reference material information.

4.7.5 Communication with the Customer

ESC's Technical Service Representatives are required to maintain good communication with customers. Customers are informed of any delays or major deviations in the analytical work of the laboratory.

4.8 COMPLAINTS

Complaints are taken very seriously, and are typically initially addressed by customer service or sales. Other applicable laboratory personnel can be involved during the corresponding investigations and any needed corrective actions to provide customer support. Records of all complaints, investigations, and corrective actions are maintained. For more information see section 4.11 below for corrective actions and SOP #020302, *Client Complaint Resolution.*

4.9 CONTROL OF NON-CONFORMING WORK

4.9.1 Identification of Non-Conforming Work

Non-conforming work is work that does not conform to customer requirements, standard specifications, or documented laboratory policies/procedures. Some examples of non-conformances are departures from SOPs/test methods or quality control results that do not meet acceptance criteria. Identification of non-conforming work can come through various sources which include, but is not limited to; results of quality control samples and instrument calibrations, observations of laboratory personnel, data review, and internal audits.

4.9.2 Policies and Procedures

Many types of non-conformances are listed in the applicable SOPs along with the responsibilities and actions that are needed. Any needed corrections for these non-conformance events are taken immediately together with any decision about the acceptability of the nonconforming work.

In the event that a non-conformance is likely to reoccur or that there is doubt about the compliance of the laboratory's operations with its own policies or procedures; laboratory personnel will investigate the significance of the non-conformance and document corrective actions if applicable. When quality of the analytical data has been adversely affected, customers are notified and work is recalled as necessary. For more information see section 4.11 below for corrective actions and the SOP #030208, *Corrective and Preventive Action*.

Customer requests for departures must be pre-approved by appropriate laboratory personnel. These planned and pre-approved departures/non-conformances do not require reviews/investigations; however, they still must be documented. When necessary, planned and pre-approved non-conformances are noted in the final analytical report to advise the data user of any ramification to data quality.

4.9.3 Release of Nonconforming Work

The laboratory allows the release of nonconforming data only with approval on a case-by-case basis by the department supervisor, or their designee. Permitted non-conformances, such as QC failures, are fully documented and include the reason for the deviation and the impact of the departure on the data. Where necessary, customer service will notify the customer of the situation and will advise of any ramifications to data quality. Also where necessary, non-conformances are noted in the final analytical report to advise the data user of any ramification to data quality.

4.9.4 Stop Work Procedures

The Compliance Director and the Quality Assurance Director have the responsibility and authority to ensure the Quality System is implemented and followed at all times. In circumstances where a laboratory is not meeting the established level of quality or not following the policies set forth in this Quality Manual, the Compliance Director and the Quality Assurance Director have the authority to halt laboratory operations should he or she deem such an action necessary. The Compliance Director and/or the Quality Assurance Director will immediately communicate the halting of operations to the laboratory senior management and will keep them posted on the progress of corrective actions.

The department supervisors and members of senior management also have the authority to halt laboratory operations should they deem this action necessary. If this is done they will notify the Compliance Director and/or the Quality Assurance Director, and they will keep them informed about the progress of corrective actions.

All laboratory personnel have the authority to halt laboratory operations in the event that a situation impacts data validity or safety. When this action is deemed necessary, then the applicable supervisor must be notified of the situation as soon as possible. The supervisor and/or members of senior management will evaluate the severity of the situation for further decision making.

Once a stop work order has been approved and implemented, the Compliance Director and/or the Quality Assurance Director have the responsibility of ensuring the effectiveness of the corrective actions taken and authorizing the resumption of work.

4.10 IMPROVEMENT

Laboratory management demonstrates its commitment to quality by providing the resources (including facilities, equipment, and personnel) to ensure the adherence to the policies and procedures documented in this Quality Assurance Manual; and to promote the continuous improvement of the quality system. Continuous improvement of the quality system is also achieved by the implementation of the various aspects of this Quality Assurance Manual which include the following:

- The quality policy and objectives
- The internal and external auditing practices
- The review and analysis of data
- The corrective action process
- The preventive action process
- The managerial review process where the various aspects of the management/quality system are summarized, evaluated, and plans for improvement are developed.

4.11 CORRECTIVE ACTIONS

During the day-to-day laboratory operations, certain occurrences may warrant the necessity of corrective actions. These occurrences may take the form of analyst errors, deficiencies in quality control, method deviations, or other unusual circumstances. The laboratory's quality system provides systematic procedures for the documentation, monitoring, completion of corrective actions, and follow-up verification of the effectiveness of these corrective actions. This is done using the laboratory's Corrective Action and Preventative Action (CAPA) system that lists at a minimum; the deficiency by issue number, the deficiency source, responsible party, root cause, resolution, due date, and date resolved.

4.11.1 General Corrective Action Procedure

The following items are examples of sources of laboratory deviations or non-conformances that warrant some form of documented corrective action:

- Internal and External Audit Deficiencies
- Unacceptable Proficiency Testing (PT) Results
- Data or Records Review Deficiencies
- Customer Complaints
- Holding Time Violations

Documentation of corrective actions may be in the form of a qualifier or comment in the analytical data and/or on the final report that explains the deficiency. Corrective actions involving sample receiving are recorded on non-conformance forms and are attached to the applicable chain of custody. Documentation of corrective actions may also be a more formal corrective action report that is entered into the laboratory's Corrective Action and Preventative Action (CAPA) system. This depends on the extent of the deficiency, method requirements, the impact on the data, and any customer requirements for documentation.

The person who discovers the deficiency or non-conformance initiates the corrective action process. If a formal corrective action report is warranted, then the person initiating the corrective action must document the issue, the affected projects/samples, any known causes of the issue, and the corrective actions that they have taken. After this documentation is completed, the corrective action report is routed to the supervisor and/or to applicable personnel for notification of the issue and review. After the corrective action report is reviewed by the supervisor and/or applicable personnel, then it is routed to the quality assurance department for final review, verification, and signoff of the corrective action.

For more information see SOP #030208, *Corrective and Preventive Action.*

4.11.2 Root Cause Analysis

It is necessary that corrective actions taken address the root cause of the issue in order to prevent reoccurrences. In some cases, an identified cause equals to the "root cause" of the issue. In other cases, an identified cause is actually the outcome or symptoms of an underlying "root cause". Root cause analysis is the key and sometimes the most difficult part in the corrective action procedure. Often the root cause is not obvious and thus a careful analysis of all potential causes of the problem is required. Potential causes could include customer requirements, the samples, sample specifications, methods and procedures, staff skills and training, consumables, or equipment and its calibration.

In the event that the root cause is not obvious, laboratory personnel and management staff will start a root cause analysis by going through an investigative process. During this process, the following general steps must be taken into account: defining the non-conformance, assigning responsibilities, determining if the condition is significant, and investigating the root cause of the nonconformance. General non-conformance investigative techniques follow the path of the sample through the process looking at each individual step in detail. The root cause must be documented within the laboratory's Corrective Action and Preventative Action (CAPA) system.

4.11.3 Selection and Implementation of Corrective Actions

Where uncertainty arises regarding the best corrective action approach for addressing the root cause of an issue, appropriate laboratory personnel will recommend corrective actions that are appropriate to the magnitude and risk of the problem that will most likely eliminate the problem and prevent recurrence. If needed, senior laboratory management will then decide the best course of action needed. The corrective action that is chosen will then be implemented and documented in the laboratory's Corrective Action and Preventative Action (CAPA) system.

4.11.4 Monitoring of Corrective Actions

Personnel in the quality assurance department are responsible for monitoring the implementation and documentation of corrective actions to ensure that the corrective actions taken are effective. This verification of the corrective actions effectiveness is documented laboratory's Corrective Action and Preventative Action (CAPA) system.

4.11.5 Additional Audits

When the identification of non-conformances or departures casts doubt on compliance with the laboratory's policies, procedures, or regulatory requirements; laboratory management ensures that appropriate areas of activity are audited in

accordance with Section 4.14.1 as soon as possible. These additional audits can be short and focused to follow-up with the implementation of the corrective actions to confirm their effectiveness. Additional full-scale audits are only necessary when a serious issue or risk to the laboratory's business is identified.

4.12 PREVENTIVE ACTIONS

Preventive action is a pro-active process to identify opportunities for improvement rather than a reaction to the identification of problems or complaints. ESC takes advantage of several information sources to identify opportunities for improvement in all its systems including technical, managerial, and quality systems. These sources include, but are not limited to, the following:

- Identification of trends during data review
- Staff meetings
- Customer feedback, including complaints
- Managerial reviews

Some examples of preventative action include, but are not limited to, the following:

- Scheduled instrument maintenance (Preventative maintenance)
- Adding additional staff
- Acquisition of new equipment
- Training activities

All laboratory personnel have the authority to offer suggestions for improvements and to recommend preventive actions. However, it is ultimately the responsibility of laboratory management for implementing preventive action. When improvement opportunities are identified or if preventative action is required; then action plans are developed, implemented, and monitored to reduce the likelihood of the occurrence of non-conformities and/or to take advantage of the opportunities for improvement.

For more information see SOP #030208, *Corrective and Preventive Action.*

4.13 CONTROL OF RECORDS

Records are usually data recordings that include annotations, such as daily refrigerator temperatures, posted to laboratory forms, lists, spreadsheets, or analyst notes on a chromatogram. Records may be on any form of media, including electronic and hardcopy. Records allow for the historical reconstruction of laboratory activities related to sample handling and analysis.

4.13.1 General

Technical and quality assurance records are established and maintained to provide evidence of conformity to requirements and of the effective operation of the quality system. Mechanisms are established for records to remain legible, readily identifiable and retrievable. The laboratory maintains a record system appropriate to its needs, records all laboratory activities, and complies with applicable standards or regulations as required.

The laboratory has defined the length of time various records, pertaining to the management system and examination results, are to be retained. Retention time is defined by the nature of examination or specifically for each record. The laboratory retains all original observations, calculations and derived data, calibration records, chain of custody and a copy of the test report for a minimum of ten years, unless otherwise required by regulatory authority.

Documented records procedures SOP# 010103, *Document Control and Distribution Procedure*, and SOP# 020304, *Protection and Transfer of Records*, are established to define the means needed for the identification, storage, protection, retrieval, retention time, transfer, and/or disposition of records.

4.13.2 Technical and Quality Records

NOTE: ALL records/data are stored for a minimum of 10 years, unless otherwise noted.

All hardcopy department logbooks, such as temperature, maintenance, and preparation logs are placed into storage boxes and archived via a unique numbering system, to the ESC storage facility. Additional information regarding reagents/standards can be found in the Standards Logger (Tree) digital archive system. This digital system is backed up according to the ESC IT backup procedure.

Archived information and access logs are protected against fire, theft, loss, environmental deterioration, vermin, and in the case of electronic records, electronic or magnetic sources.

Data Storage Criteria	
Data Type	**Storage Criteria**
Manual Data Wet Chemistry	All manually generated data are stored in specific laboratory analysis workbooks. Each individual analysis is located in a separate notebook which contains all data relating to the test including, calibration curves/data, QC charts/limits, SOP, and completed analysis sheets. These notebooks are centrally located and contain completed data that is filed by analysis and date analyzed. Monthly – Data is removed from the notebook and placed in a dedicated filing cabinet. Semi-annually – Data is removed from the filing cabinet, placed in storage boxes and archived, via a unique numbering system, in the ESC storage facility
Manual Data Prep Labs	All logbooks utilized in manually recording sample preparation information are placed into storage boxes and archived, via a unique numbering system, in the ESC storage facility. This includes organic prep, metals prep, and TCLP.
Manual Data Env. Micro, Mold	All manually generated data is stored in specific laboratory files and notebooks. These files are centrally located and contain completed data that is filed by analysis and date analyzed. Data is placed into storage boxes and (when full) archived, via a unique numbering system, in the ESC storage facility.
All Data Aquatic Toxicity	All manually generated data is stored in specific laboratory files and notebooks. These files are centrally located and contain completed data that is filed by analysis and date analyzed. Data is placed into storage boxes and (when full) archived, via a unique numbering system, in the ESC storage facility. Final reports and Reference Toxicant results are also scanned into ESC's electronic document management system. The data storage device on which this data resides is backed up daily. Data files are archived on to magnetic tape and retained per laboratory policy.
Computerized Data - Organic Dept.	Injection logs are printed to PDF file and maintained with the data. The instrument data is printed to a secure server and remains in a format that cannot be changed after printed. Upon printing, the data in the original file is generated. This storage system is backed up nightly utilizing a seven-day rotation cycle. The data is immediately available for up to two years. After two years, raw instrument data files are archived onto a separate secure server and kept a minimum of ten years. Original raw data files cannot be edited.
Computerized Data – Inorganic Metals Dept.	All data produced by metals instrumentation is backed up to a secure drive, nightly, utilizing a seven-day rotation cycle. All data is archived on a network attached storage device and is immediately available for up to two years. After two years, raw instrument data files are archived on to a separate secure server and kept a minimum of ten years. Original raw data files cannot be edited.
Final Report Storage - LIMS	The LIMS facilitates access to any finished data and sample information by customer code, sample number, and parameter run number. Furthermore, any data pertaining to a sample or customer can be obtained. The LIMS also contains the information from the COC such as sample description, time and date collected, sampler ID, container type, preservative, sample receipt data, finished/approved analytical data, analyst, etc. The LIMS Oracle Database is backed up daily on tape. The back up tape is kept in secure storage. While all LIMS data are accessible, data older than six months is moved from the active production database and is available in an archive database.
Final Report Storage - PDF	Copies of all reports are stored according to customer code in PDF format on a network attached storage device and are immediately available for up to ten years**.** After ten years data files are archived onto magnetic tape and kept an additional ten years. These reports include chain of custody forms, login confirmation reports, the final approved printed report, invoices and any other associated documents. Samples that require subcontract work also have a copy of the final report in the customer file.
Misc. Data Storage	Company records that are not stored on a secure electronic device are placed in storage boxes and archived, via a unique numbering system, in the ESC storage facility. This includes quality records, such as audits, state certifications, PT results, internal audits, corrective actions, training files, logbooks, etc.

4.13.3 Records Disposal

Records that have exceeded the required storage requirement are disposed of through the use of professional records destruction firm or as required by regulatory or customer requirements. ESC retains the manifest of documents destroyed and files the verification receipt that is generated at the time of destruction. Additional guidance for records disposal is provided in the ESC SOP#020304, *Protection and Transfer of Laboratory Records*.

4.13.4 Records Transfer

In the event that corporate ownership is transferred or that laboratory activities are terminated for any reason, all records become property of the transferee in accordance with ESC SOP# 020304, *Protection and Transfer of Laboratory Records*.

4.14 AUDITS

Audits measure laboratory performance and verify compliance with accreditation and project requirements. Audits specifically provide management with an on-going assessment of the management system. They are also instrumental in identifying areas where improvement in the management/quality system will increase the reliability of data. Laboratory management is promptly notified of any finding that is of ethical concern.

4.14.1 Internal Audits

The quality assurance department is responsible for designing and/or conducting internal audits in accordance with a predetermined schedule and procedure. The purpose of these internal audits is to verify compliance with policies and procedures, and also to verify the on-going effectiveness of the laboratory's management system. Since internal audits represent an independent assessment of laboratory functions, the auditor must be functionally independent from laboratory operations to ensure objectivity. The auditor must be trained, qualified, and familiar enough with the objectives, principles, and procedures of laboratory operations to be able to perform a thorough and effective evaluation.

The complete internal audit process consists of the following sections:

- System and Method Audits – These are the traditional internal audit function and include analyst interviews to help determine whether laboratory practice matches method requirements and SOP language. Applicable raw analytical data and/or final report reviews are usually conducted in conjunction with these traditional internal audits. These audits are conducted according to a predetermined schedule.
- Compliance Data Reviews – These are thorough raw data and record reviews conducted by the quality assurance department that include (but are not limited to) sample receipt records, sample preparation records, analytical records, and the final analytical reports. A portion of the analytical data produced by the laboratory is randomly selected to undergo a compliance data review. These reviews are outside of the laboratory production environment which allows the data to be very closely examined without the pressure of time constraints.
- Corrective action follow-up audits are conducted on an as needed basis to ensure that documented corrective actions are implemented and to verify their effectiveness.

Full descriptions of the system and method internal audits are composed to include the following: identification of the section audited, the audit date, and the observations/findings of the audit. Findings from all internal audit processes will be routed to the applicable laboratory personnel for corrective action. The

responsible party will propose a plan of correction in a timely manner to correct all of the cited deficiencies. The proposed plan should include a time frame for the competition of the corrective actions. This time frame should depend on the complexity of the deficiencies and the amount of resources needed to properly correct the deficiency. The quality department reviews the responses to the internal audit findings. If the responses are determined to be adequate, then the quality department will use the action plan with the given time frame for verifying the completion of the corrective action(s). If the responses are determined to be inadequate, then the response is returned to the responsible party for modification. To complete the internal audit process, the quality department performs a re-examination of the areas where deficiencies were found to verify that all proposed corrective actions have been implemented. An audit deficiency is considered closed once implementation of the necessary corrective action has been audited and verified. If corrective action cannot be verified, the associated deficiency remains open until that action is completed.

In addition to the scheduled internal audits, unscheduled internal audits are conducted whenever doubts are cast on the laboratory's compliance with regulatory requirements or its own policies and procedures. These unscheduled internal audits may be conducted at any time and may be performed without an announcement to laboratory personnel.

When internal audit findings cast doubt on the validity of the laboratory’s testing results, the laboratory will take immediate corrective action and any affected customers should be notified in writing within one week of the discovery of the issue. If the issue is complex and the full scope of affected customers is not easily determined, then additional time might be required. However, this additional timeframe for customer notification of complex issues should not exceed one month of discovery.

All investigations resulting from data integrity issues are conducted in a confidential manner until they are completed. These investigations are documented, as well as any notifications made to clients receiving any affected data.

Additional information can be found in the SOP #010104, *Internal Audits.*

4.14.2 External Audits

It is the laboratory's policy to cooperate and assist with all external audits, whether performed by customers or an accrediting body. Management ensures that all areas of the laboratory are accessible to auditors as applicable and that appropriate personnel are available to assist in conducting the audit.

Audit teams external to the laboratory's organization will review the laboratory to assess the effectiveness of systems and degree of technical expertise. The quality department personnel will host the audit team and assist in facilitation of the audit process. Audit teams will usually prepare a formalized audit report listing deficiencies, recommendations, and/or observations. In some cases items of concern are discussed during an audit debrief that is conducted at the end of the external audit.

The laboratory personnel develop corrective action plans to address any external audit deficiencies with the assistance/guidance of the quality department. Laboratory management will ensure that the necessary resources are provided to effectively develop and implement the corrective action plans. The quality department collates this information and provides a written response to the audit team. The response contains the corrective action plan and expected completion dates for each element of the plan. The quality department is also responsible for following-up with laboratory personnel to ensure corrective actions are implemented and they are effective.

4.14.3 Performance Audits and Proficiency Testing

Performance audits are conducted periodically. Examples of performance audits include Proficiency Test (PT) sample analysis, internal single-blind sample analysis, and the analysis of double-blind samples that are submitted through a provider or a customer. Anything that tests the performance of the analyst and/or the method is considered to be a performance audit.

The laboratory participates in various proficiency testing samples (PT) as required by each accreditation, and obtains test samples from approved providers. Some exceptions are made for analytes where there is no PT available from an approved PT provider.

PT samples are treated as typical customer samples, utilizing the same staff, methods, equipment, facilities, and frequency of analysis. PT samples are included in the laboratory's normal analytical processes and do not receive extraordinary attention due to their nature.

The laboratory does not share PT samples with other laboratories, does not communicate with other laboratories regarding current PT sample results, and does not

attempt to obtain the assigned value of any PT sample from the PT provider.

The laboratory initiates an investigation and corrective action plan whenever PT results are deemed unacceptable by the PT provider. Additional PTs will be analyzed and reported as needed for accreditation purposes.

Additional information can be found in the SOP #030212, *Proficiency Testing Program.*

4.15 MANAGEMENT REVIEW

Laboratory management reviews the management system on an annual basis at a minimum. This allows for assessing program effectiveness and introducing changes and/or improvements.

At a minimum, following topics are reviewed and discussed:

- The suitability of policies and procedures
- Reports from managerial and supervisory personnel
- The outcome of recent internal audits
- Corrective and preventive actions
- Assessments by external bodies
- The results of interlaboratory comparisons or proficiency tests
- Changes in the volume and type of the work
- Customer feedback, including complaints
- Recommendations for improvement
- Other relevant factors, such as quality control activities, resources, and staff training

This managerial review must be documented for future reference. The results of the managerial review must feed into the laboratory planning system and must include goals, objectives, and action plans. Laboratory management ensures that any actions identified during the review are carried out within an appropriate and agreed upon timescale.

For more information see the SOP #010105, *Management Review*.

5.0 TECHNICAL REQUIREMENTS

5.1 GENERAL

5.1.1 ESC Lab Sciences recognizes that many factors determine the correctness and reliability of the analyses performed by a laboratory. These factors include contributions from:

- Human factors (See Section 5.2)
- Accommodations and environmental conditions (See Section 5.3)
- Test methods and method validation (See Section 5.4)
- Equipment (See Section 5.5)
- Measurement traceability (See Section 5.6)
- Sampling (See Section 5.7)
- Handling of samples (See Section 5.8).

5.1.2 The extent to which the factors contribute to the total uncertainty of measurement differs considerably between types of analyses. ESC Lab Sciences takes into account these factors in developing analytical procedures, in the training and qualifications of personnel, and in the selection and calibration of the equipment utilized.

5.2 PERSONNEL

5.2.1 General Personnel Management

ESC management ensures the competency of all who operate specific equipment, who perform analyses, and who evaluate results and approve data reports. Personnel performing specific tasks are qualified on the basis of appropriate education, training, experience, and/or demonstrated skills, as required.

5.2.2 Training

All personnel are trained and competent in their assigned tasks before they contribute to functions that can affect data quality. It is management's responsibility to ensure personnel are appropriately trained. All training and education requirements are outlined in SOP #030205, *Technical Training and Personnel Qualifications* and in SOP #350355, *Technical Training and Personnel Qualifications for Biology*. Training requirements for safety and health are listed in the *Chemical Hygiene Plan*. These procedures are reviewed/updated periodically by laboratory management. Training records are maintained by the laboratory for a minimum of 10 years.

5.2.2.1 Demonstration of Capability (DOC)

Analysts complete an initial demonstration of capability (IDOC) study prior to performing a method or when there is a change in instrument type, personnel, or test method. IDOCs are also performed when a method has not been performed by the laboratory or analyst in a 12-month period. The mean recovery and standard deviation of each analyte, taken from 4 replicates of laboratory control samples, is calculated and compared to method criteria or established laboratory criteria for evaluation of acceptance. For methods or procedures that do not lend themselves to the “4-replicate approach, the demonstration of capability requirements will be specified in the applicable SOP. Copies of all demonstrations of capability are maintained for future reference.

Demonstrations of capability are verified on an annual basis. These are Continuing Demonstrations of Capability (CDOC). For CDOCs Performance Testing (PT) samples may be used in lieu of the 4-replicate approach listed above.

For more information see the SOP #030205, *Technical Training and Personnel Qualifications* and SOP #350355, *Technical Training and Personnel Qualifications for Biology*.

5.2.2.2 Training for New Staff

New staff members are given the following training, where appropriate:

- Ethics and Data Integrity
- ESC Policy Manual
- ESC Quality Assurance Manual
- Chemical Hygiene Plan (safety)
- Applicable standard operating procedures
- Basic laboratory tasks such as balance, thermometer, and pipette operations
- Use of laboratory records
- Any other specific training as appropriate to their function

Analysts must complete training satisfactory before they can work independently. When staff members undergo training, adequate and appropriate supervision by fully trained analysts is provided. Only when a new analyst has successfully passed their Initial Demonstration of Capability (IDOC) described above, may he or she conduct testing of customer samples.

For more information see the SOP #030205, *Technical Training and Personnel Qualifications* and SOP #350355, *Technical Training and Personnel Qualifications for Biology*.

5.2.2.3 Ongoing Training

Staff members are given the following ongoing training:

- Ethics and Data Integrity Training
- Safety Training
- Routine Training – Routine training may become necessary for a person to perform a particular job effectively. This includes any changes in policies and procedures as appropriate.
- Special Training – Special training may become required as a result of new technologies, contracts, expanding markets, company-wide improvement programs, new method development, etc.

Analysts must satisfactorily perform Continuing Demonstrations of Capability (CDOC) on an annual basis.

For more information see the SOP #030205, *Technical Training and Personnel Qualifications* and SOP #350355, *Technical Training and Personnel Qualifications for Biology*.

5.2.2.4 Ethics and Data Integrity Training ”

Data integrity training is provided to all new employees (including contract and temporary), and a refresher is given at least annually for all employees. Employees are required to understand that any infractions of the laboratory data integrity procedures shall result in a detailed investigation that could lead to very serious consequences including immediate termination, debarment, or civil/criminal prosecution. The initial data integrity training and the annual refresher training needs to have a signature attendance sheet or other form of documentation that demonstrates all staff have participated and understand their obligations related to data integrity.

All ESC personnel, including contract and temporary, are required to sign an “Attestation of Ethics and Confidentiality at the time of employment and during annual refresher training. This document clearly identifies inappropriate and questionable behavior. Violations of this document result in serious consequences, including prosecution and termination, if necessary. The ESC Policy Manual addresses this subject in detail. Also see SOP# 010102, *Ethics, Data Integrity, and Confidentiality* for more information.

Data integrity training emphasizes the importance of proper written narration on the part of the analyst with respect to those cases where analytical data may be useful, but are in one sense or another partially deficient. The following topics and activities are covered:

- ESC’s mission and its relationship to the critical need for honesty and full disclosure in all analytical reporting

- How and when to report data integrity issues
- Record keeping
- Training, including discussion regarding all data integrity procedures
- Data integrity training documentation
- In-depth data monitoring and data integrity procedure documentation
- Specific examples of breaches of ethical behavior such as improper data manipulations, adjustments of instrument time clocks, and inappropriate changes in concentrations of standards.

5.2.2.5 Identification of Training Needs

In order to ensure personnel are appropriately trained, laboratory management is responsible for identifying training needs for both current and future anticipated laboratory tasks. This includes (but is not limited to) the following:

- Evaluation of routine quality control data
- Proficiency testing results
- Findings of internal and external audits
- Management reviews
- Periodic performance reviews

5.2.2.6 Evaluation of the Effectiveness of Training

In order to ensure personnel are appropriately trained, laboratory management is responsible for evaluating the effectiveness of the training program. This includes (but is not limited to) the following:

- Evaluations of Demonstrations of Capability (DOCs)
- Monitoring ongoing quality control data
- Proficiency testing results

5.2.3 Competency and Supervision of Personnel

Laboratory management ensures all personnel (including part-time, temporary, contracted, and administrative personnel) are competent, appropriately supervised, and work in accordance to the established management system. This includes training in policies, procedures, ethics, laboratory quality assurance, and safety as applicable to their role in the laboratory.

5.2.4 Job Descriptions

Employee qualification requirements are maintained by the Human Resources Department and are facilitated through the use of written job descriptions. Educational requirements and experience are included in the job description. Laboratory management determines the specific education and experience

requirements for individual positions within the laboratory based on the specific department needs.

5.2.5 Authorization of Technical Personnel

Laboratory management authorizes specific personnel to perform particular technical duties. Records of the relevant authorization(s), education, and experience of all technical personnel are maintained by the Human Resources Department. Confirmation of competence of all technical personnel is required initially by successfully performing a demonstration of capability. All technical personnel are also required to continue to demonstrate their capability at least annually to produce reliable results through accurate analysis of certified reference materials, proficiency testing samples, and/or routine quality control samples to remain authorized to perform particular technical duties.

5.3 ACCOMMODATION & FACILITY DESIGN

5.3.1 Laboratory Facilities

The design of the laboratory supports good laboratory practices and does not adversely affect measurement integrity.

5.3.2 Environmental Conditions

All ESC laboratory facilities, analytical areas, energy sources, lighting, heating, and ventilation facilitate proper performance of calibrations and tests. The laboratory ensures that housekeeping, electromagnetic interference, humidity, line voltage, temperature, sound and vibration levels are appropriately controlled to ensure the integrity of specific measurement results and to prevent adverse effects on accuracy or increases in the uncertainty of each measurement.

Environmental conditions are monitored, controlled, and recorded as required by the relevant specifications, methods, and procedures. Laboratory operations are stopped if it is discovered that the laboratory's environmental conditions jeopardize the analytical results.

5.3.3 Separation of Incompatible Activities

ESC Lab Sciences maintains multiple buildings on its campus. This allows for physical separation of incompatible analytical activities. For example, the analysis for volatile organic compounds is in a separate building from where samples are extracted for semi-volatile organic compounds.

Each laboratory structure is specifically designed for the type of analytical activity that it contains. The air handling systems, power supplies, and gas supplies are specific for each laboratory department.

5.3.4 Laboratory Security

Laboratory security is maintained by controlled access and through video surveillance. Entrance into any ESC building requires an electronic ID badge with appropriate assigned access. Access is controlled to each area depending on the required personnel, the sensitivity of the operations performed, and possible safety concerns. The main entrance is kept unlocked during normal business hours for visitors, and is continuously monitored by laboratory staff. All visitors must sign a visitor's log, and a staff member must accompany them during the duration of their stay.

5.3.5 Good Housekeeping

ESC ensures good housekeeping practices in all facilities to maintain a standard of cleanliness necessary for analytical integrity and personnel health and safety. Where necessary, areas are periodically monitored to detect and resolve specific contamination and/or possible safety issues.

5.4 TEST METHODS AND VALIDATION

5.4.1 General

ESC Lab Sciences uses appropriate methods and procedures for all analyses within its scope. These include sampling, handling, transport, storage, and preparation of samples to be analyzed, and, where appropriate, an estimation of the associated measurement uncertainty as well as statistical techniques for analysis of data.

ESC Lab Sciences has instructions (SOPs) on the use and operation of all relevant equipment and on the handling and preparation of samples for analysis, where the absence of such instructions could jeopardize the results. All instructions, standards, manuals and reference data relevant to the work of the laboratory are maintained current and are readily available to personnel (see section 4.3). Deviations from methods occur only if the deviation has been documented, technically justified, authorized, and accepted by the customer.

5.4.2 Selection of Methods

ESC Lab Sciences uses analytical methods, including methods for sampling, which meet the needs of the customer and are appropriate for the analyses performed. Methods utilized are preferably those published as international, regional, or national standards. The laboratory ensures that it uses the latest valid

edition of a method unless it is not appropriate or possible to do so or unless regulatory requirements dictate specific revision use. Methods are supplemented with Standard Operating Procedures that list additional details to ensure consistent application.

When a customer does not specify the method to be used, the laboratory selects appropriate and approved methods that have been designated by the project's regulatory program. The customer is informed as to the method chosen.

The laboratory confirms that it can properly operate published analytical methods before analyzing samples (see section 5.4.5). If there is a change in the published analytical method, then the confirmation is repeated.

ESC Lab Sciences will inform customers when methods they choose are considered inappropriate and/or out of date.

5.4.3 Laboratory Developed Methods

Introduction of analytical methods developed by the laboratory for its own use is a planned activity and is assigned to qualified personnel equipped with adequate resources.

Plans are updated as development proceeds and effective communication is maintained with all personnel involved in the development process.

5.4.4 Non-Standard Methods

When it is necessary to employ methods not published and/or approved by industry standards, these are subject to agreement with the customer and must include a clear specification of the customer's requirements and the purpose of the analysis. The method developed must be validated appropriately before use.

For new non-standard analytical methods, procedures are developed prior to the analysis of samples and contain at least the following information:

- Appropriate identification
- Scope
- Description of the type of item to be analyzed
- Parameters or quantities and ranges to be determined
- Apparatus and equipment, including technical performance requirements
- Reference standards and reference materials required
- Environmental conditions required and any stabilization period needed
- Description of the procedure, including:
  - Affixing identification marks, handling, transporting, storing and preparing of items
  - Checks to be made before the work is started

  - Verifying equipment function and, where required, calibrating and/or adjusting the equipment before each use
  - Method of recording the observations and results
  - Any safety measures to be observed
- Criteria and/or requirements for approval/rejection
- Data to be recorded and method of analysis and presentation
- Uncertainty or procedure for estimating uncertainty

5.4.5 Validation of Methods (Also see SOP #030211, *Method Validation*)

5.4.5.1 Validation Description

Validation is a process of confirmation by examination and the provision of objective evidence that the stated requirements for a specific method/procedure are fulfilled.

5.4.5.2 Validation Summary

The laboratory validates all analytical methods used to some degree. The validation is as extensive as is necessary to meet the needs in the given application or field of application. The laboratory records the results obtained, the procedure used for the validation, and a statement as to whether the method is fit for the intended use.

5.4.5.3 Validation for Customer Need

The range and accuracy of the values obtainable from validated methods are assessed for the intended use as relevant to the customers' needs. Examples of this assessment include examining the uncertainty of the results, detection limit, selectivity of the method, linearity, limit of repeatability and/or reproducibility, robustness against external influences, and/or cross sensitivity against interference from the matrix of the sample.

5.4.5.4 Method Detection Limits and Reporting Limits

Descriptions of analytes, preparative and analytical methods, matrices, accuracy and precision targets, and MDLs and RLs are presented in the QA Manual Appendices.

Limits of Detection (LODs)/Method Detection Limits (MDLs)

Detection limits are determined annually (or after any major changes to the analytical system and/or procedures) and are comparable to those established by the EPA and are not typically lower than recommended detection limits. To determine whether the EPA detection limit is being achieved, an MDL study is performed according to 40 CFR Part 136, Appendix B or the currently accepted and approved guidance. When using the Appendix B guidance, the standard deviation of, at least, seven replicate standards at or near the expected detection limit is calculated. MDLs are determined such that the risk of reporting a false positive is less than 1%. The method detection limit (MDL) is calculated as follows:

MDL = T S

where: S = Standard Deviation of replicate measurements
T = Student's t value appropriate for a 99% confidence level and a standard deviation estimate with n-1 degrees of freedom.

If the MDL is higher than the EPA-method-suggested MDL, the calculated value is used as a basis for establishing the reporting limit (RL) for reporting. MDLs are re-calculated on an annual basis or sooner if a material change in the instrumentation or method is enacted, or a change in the calibration response factor is noted. Additional studies may also be conducted to enhance the program.

Published MDLs may be set higher than experimentally determined MDLs to: 1) avoid observed positive interferences from matrix effects or common reagent contaminants or 2) for reporting convenience (i.e., to group common compounds with similar but slightly different experimentally determined MDLs).

Method detection limit studies may also utilize additional study components to better reflect practices to produce a more realistic detection limit as approved by regulatory guidance/requirements. Blank background studies yielding a value for the blank contributions at low level quantitations during routine analysis may be utilized to calculate detection limits that further ensure that the incidence of reporting false positives and false negatives is greatly reduced in some applications.

Any alternate or modified method for the determination of MDL studies utilized at ESC must be approved for the application for which it is used and be technically justified in its use to provide an improvement in the data being generated within the study.

For more information see SOP# 030206, *Method Detection Limits*

Limits of Quantitation (LOQs)/Reporting Limits (RLs)

A limit of quantitation (LOQ) for every analyte of concern must be determined. The LOQ must be higher than the MDL/LOD and are typically set 3 -10 times the calculated MDL determined above. The LOQ is often referred to as the Reporting Limit (RL). This RL is based on the lowest calibration standard concentration that is used in each initial calibration. Results below this level are not allowed to be reported without qualification since the results would not be substantiated by a calibration standard". For methods with a determined LOD, results can be reported out below the LOQ but above the LOD if they are properly qualified (e.g. J flag).

5.4.5.5 Demonstration of Capability

Analysts complete an initial demonstration of capability (IDOC) study prior to performing a method or when there is a change in instrument type, personnel, or test method. IDOCs are also performed when a method has not been performed by the laboratory or analyst in a 12-month period. The mean recovery and standard deviation of each analyte, taken from 4 replicates of laboratory control samples, is calculated and compared to method criteria or established laboratory criteria for evaluation of acceptance. For methods or procedures that do not lend themselves to the "4-replicate approach, the demonstration of capability requirements will be specified in the applicable SOP. Copies of all demonstrations of capability are maintained for future reference.

Demonstrations of capability are verified on an annual basis. These are Continuing Demonstrations of Capability (CDOC). For CDOCs Performance Testing (PT) samples may be used in lieu of the 4-replicate approach listed above.

For more information see the SOP #030205, *Technical Training and Personnel Qualifications* and SOP #350355, *Technical Training and Personnel Qualifications for Biology*.

5.4.6 Measurement Uncertainty

When required, or upon customer request, ESC Lab Sciences can provide an estimate of the analytical uncertainty of test results.

The exact nature of some test methods may preclude rigorous, statistically valid estimation of analytical uncertainty. In these cases the laboratory attempts to identify all components of analytical uncertainty and make a reasonable estimation, and ensures that the form of data reporting does not give a wrong impression of the uncertainty. A reasonable estimation shall be based on knowledge of method performance and previous experience. When estimating the analytical uncertainty, all uncertainty components which are of importance in the given situation shall be taken into account.

In those cases where a well-recognized test method specifies limits to the values of the major source of uncertainty of measurement and specifies the form of presentation of calculated results, the laboratory is considered to have satisfied the requirements on analytical uncertainty by following the test method and reporting instructions.

For more information about the estimation of analytical measurement uncertainty see SOP #030221, *Measurement of Uncertainty*

5.4.7 Control of Data

5.4.7.1 Calculations and Data Transfer Checks

To ensure that data is protected from inadvertent changes or unintentional destruction, the laboratory uses procedures to check calculations and data transfers. This includes (but is not limited to) the following:

- Peer data review and internal audits of raw data
- Calculations on electronic benchsheets/spreadsheets are password protected
- Where possible, audit trail software features are utilized
- Where possible, data is uploaded directly from the instrument
- Electronic data files are backed-up routinely

5.4.7.2 Automated Acquisition

When computers or automated equipment are used for the acquisition, processing, recording, reporting, storage or retrieval of data, the laboratory ensures that:

- Computer software developed by the laboratory is documented in sufficient detail and suitably validated as being adequate for use
- Procedures are established and implemented for protecting the data. Such procedures include (but are not be limited to) integrity and confidentiality of data entry or collection, data storage, data transmission, and data processing
- Computers and automated equipment are maintained to ensure proper function and are provided with the environmental and operating conditions necessary to maintain the integrity of data
- Individual user names and passwords are required for all Laboratory Information Management Systems (LIMS)
- Upon employment, laboratory employees are provided initial training in computer security awareness and ongoing refresher training is conducted an annual basis
- Periodic inspections of LIMS are performed to ensure the integrity of electronic data
- Customers are notified prior to changes in LIMS software or hardware configurations that will adversely affect the customer's electronic data
- Spreadsheets used for calculations are verified before initial use and after any changes to equations or formulas, including software revision upgrades. Formula cells are write-protected to minimize inadvertent changes to the formulas.
- Procedures have been established for:
  - Methods of software development that are based on the size and nature of the software being developed
  - Testing and QC methods to ensure that all software accurately performs its intended functions, including:
    - Acceptance criteria
    - Tests to be used
    - Personnel responsible for conducting the tests
    - Records of test results
    - Frequency of continuing verification of the software
    - Test review and approvals
  - Software change control methods that include instructions for requesting, authorizing, requirements to be met by the software change, testing, QC, approving, implementing changes, and establishing priority of change requests

  - Software version control methods that record the software version currently used. Data sets are recorded with the date and time of generation and/or the software version used to generate the data set;
  - Maintaining a historical file of software, software operating procedures, software changes, and software version numbers
  - Defining the acceptance criteria, testing, records, and approval required for changes to LIMS hardware and communication equipment.
- Records maintained in the laboratory to demonstrate the validity of laboratory generated software include:
  - Software description and functional requirements
  - Listing of algorithms and formulas
  - Testing and QA records
  - Installation, operation and maintenance records
- Electronic data security measures ensure the following:
  - Individual user names and passwords have been implemented
  - Operating system privileges and file access safeguards are implemented to restrict the user of the LIMS data to users with authorized access ”
  - All LIMS users are trained in computer awareness security on an annual basis
  - System events, such as log-on failures or break-in attempts are monitored
  - The electronic data management system is protected from the introduction of computer viruses
  - System backups occur on a regular and published schedule and can be performed by more than just one person
  - Testing of the system backups must be performed and recorded to demonstrate that the backup systems contain all required data
  - Physical access to the servers is limited by security measures
- Commercial “off the shelf software, e.g., word processing, database and statistical programs in general use within its designed application range may be considered sufficiently validated. However, laboratory software configuration/modifications are validated as above.

ESC Software Systems

Table 5.4.7a LIMS	
System	**Description**
LIMS	The LIMS is a computerized database for data management. Access to the system is protected by coded password and access is granted based on user need.
Security	Level 1. Login, sample status, shipping/sample kits. General access, every station has access. Level 2. Data Review, data approval, edit data. The secondary review team, lab supervisors, and QA have access to this level.
Hardcopy Records	All paper records are retained by ESC and/or are stored within ESC's Document Management System (Cyberlab/Openlab) in pdf and/or excel format. As the pages become historical (prior to the current working range of log numbers), they are removed from the logbook, prep book, or workbook in sequential order and permanently bound for storage in banker's boxes and/or are stored within ESC's Document Management System (Cyberlab/Openlab) in pdf and/or excel format. They are cross-referenced by sample log number, date and storage number.
Data Records	*Data* is available on electronic media. *Revisions* to the LIMS software are documented within the code. Each revision indicates the change in function, programmer's initials, and date of change. Programming has limited access and is accessible only by approved individuals through the use of passwords.
Calculations	All calculations performed by the LIMS are approved and submitted by the Laboratory Supervisors. Each calculation is tested parallel to manual calculations to ensure proper function.
Automatic Data Transfer	Data is transferred electronically from instrumentation by way of ESC customized software (Tree) directly to the LIMS. Data is also transferred electronically by way of ESC customized software (Prep Data) that transfers/saves Prep Data directly into the LIMS Database. Once the data has been transferred, it undergoes a screen review to ensure it has been transferred properly.

Table 5.4.7b AUXILIARY SOFTWARE	
System	**Description**
Auxiliary	Auxiliary Computer and Software Used to Generate and Validate Data
General	Several instruments have their own dedicated single computer and manufacturer-designed software to run them. Instruction manuals and other documentation provided by each manufacturer are maintained. ESC receives updates as they become available from the manufacturer. All raw and filtered data is stored on media (with uniquely titled data files on floppy discs) and all associated printouts and paperwork is filed. The original raw data is not accessed again unless it is subjected to uncertainty.
Method Files	Creation of any method or analyte files, necessary to run the appropriate analyses is the responsibility of the Department Supervisor. The Supervisor verifies that the compounds, wavelengths, retention time windows, calculation criteria, and other relevant parameters are correctly input into the specific method file. Analysts may only use the method files that have been specifically generated by the Supervisor.
Supplier Info	All purchased software that is used in conjunction with software specific instruments is guaranteed by the supplier to function as required. The supplier of the software performs all troubleshooting or software upgrades and revisions.
Validation	Computer software is validated for proper performance. The result of the validation is recorded, when in-house programming is the source of the calculation.

5.4.7.3 Data Reduction and Review

All analytical data must undergo a multi-tiered review process prior to being reported to the customer. Data review is the process of examining data and accepting or rejecting it based on pre-defined criteria. These review steps are designed to ensure that reported data is free from errors and any non-conformances are properly documented. The laboratory's multi-tiered data review process is discussed below. Additional information regarding the data reduction and review process can be found in SOP #030201, *Data Handling & Reporting* and SOP #030227, *Data Review*.

Primary Data Review – Analysts performing the analysis are responsible for the initial data reduction and review, and have the primary responsibility for the quality of the data produced. The analysts initiate the data review process by reviewing and accepting/rejecting the data. This includes, but is not limited to; confirming all samples were prepared/analyzed according to the appropriate method and laboratory SOP, verifying dilutions are calculating properly, ensuring good chromatography, verifying proper spectral interpretations, evaluating quality control data, verifying that any customer/project specific requirements are met, and noting any non-conformances. The primary analyst is also responsible for compiling the initial data package for further data review.

Secondary Data Review – After the analyst have completed the primary data review process, the data package is then available for secondary data review that is performed by a qualified reviewer. This reviewer provides an independent technical assessment of the data. This includes, but is not limited to; confirming all samples were prepared/analyzed according to the appropriate method and laboratory SOP, verifying dilutions are calculating properly, ensuring good chromatography, verifying proper spectral interpretations, evaluating quality control data, verifying that any customer/project specific requirements are met, and noting any non-conformances. Secondary data reviews must also verify that all manual entries of raw data are accurate and there are no transcription errors.

Final Administrative Review – All final reports receive a final administrative review of some degree. Once the data have been technically reviewed and approved in the secondary data review process, authorization for release of the data from the analytical section is indicated in the LIMS. A Technical Service Representatives (TSR) will then perform a final administrative review of the data which includes examining the report for method appropriateness, detection limit/QC acceptability, and any other apparent errors. If no errors are found, the TSR approves the report in LIMS and the customer has the reports emailed to them. If errors are noted, the data is returned to the department for correction and resubmission to the TSR. In the case of DoD work, 100% of all packages must have a final administrative review to confirm that primary and secondary reviews were recorded properly and the data package is complete.

Compliance Data Review – Compliance data reviews are performed by the Quality Department staff and are considered to be part of the overall internal audit program of the laboratory. These reviews are typically performed after the data has been released to the customer. A list is produced weekly from LIMS showing all methods run by the laboratory and how many batches were analyzed the previous week. Some of these data packages will undergo a compliance data review as per a schedule set by this department. For DoD work, at least 10% of all data packages will reviewed for technical completeness/accuracy.

5.5 EQUIPMENT

5.5.1 Availability of Equipment

Laboratory management ensures that the laboratory is furnished with all the equipment required for the correct performance of the analytical tests it performs. In cases where the laboratory needs to use equipment outside its permanent control, the laboratory ensures that all requirements related to calibration, maintenance, and records are satisfied.

5.5.2 Calibration of Equipment

The laboratory ensures that equipment and its software used for sampling and analysis is capable of achieving the accuracy required and complies with specifications relevant to the methods concerned. Calibration procedures are established for instruments and equipment that have a significant effect on the analytical results. Before being placed into service, newly obtained equipment (including that used for sampling) is calibrated and/or verified to establish that it meets the laboratory's specification requirements and complies with the method specifications. All analytical equipment is calibrated and/or verified before use.

For analytical instrumentation, the most appropriate curve fitting model from among the following choices must be utilized (given in the order of preference):

- Average Response Factor
- Linear – No Weighting
- Linear – 1/X Weighting
- Linear – $1/X^2$ Weighting
- Quadratic

When second order (quadratic) curves are evaluated, acceptability must include an assessment of a graphic representation of the curve to confirm that this fit type is not being used to mask detector saturation and that the curve (which defines a parabola) does not result in two concentrations for one response. Higher order polynomial curves (i.e., third-order and greater) are not allowed at ESC.

5.5.3 Operation of Equipment

Analytical equipment is operated only by authorized personnel. Up-to-date instructions and procedures for the use and maintenance of analytical equipment are readily available for use by the appropriate laboratory personnel. This includes any relevant equipment manuals provided by the manufacturer.

5.5.4 Identification of Equipment

Analytical equipment used that is significant to the analytical results is uniquely identified when practical.

5.5.5 Records of Equipment

Records are maintained for analytical equipment used that is significant to the analytical results. These records include at least the following:

- Identity of the equipment (and software if applicable)
- Manufacturer's name, type of equipment, and serial number or other unique identification
- Checks that equipment complies with specifications (see 5.5.2)
- Current location, where appropriate
- Manufacturer's instructions, if available, or reference to their location
- Dates, results, and reports of all calibrations, adjustments, acceptance criteria, and the due date of next calibration where appropriate
- Maintenance carried out to date. Also, the maintenance plan where appropriate
- Any damage, malfunction, modification, or repair to the equipment
- Date placed in service
- Condition when received (e.g., new, used, reconditioned)
- Operational status
- Instrument configuration and settings

5.5.6 Handling of Equipment

The laboratory has established procedures for the safe handling, transport, storage, use, and any planned maintenance of analytical equipment to ensure proper functioning and in order to prevent contamination or deterioration. These procedures include the checks necessary to ensure proper functionality when analytical equipment is returned from being used outside of the permanent control of the laboratory.

5.5.7 Out of Service Equipment

Equipment that has been subjected to overloading, mishandling, gives suspect results, has been shown to be defective, or is performing outside of specified limits is taken out of service. Out of service equipment is isolated and/or clearly labeled to prevent accidental use until it has been repaired and shown to perform correctly. When analytical equipment is taken out of service, the laboratory examines the potential effect it may have had on previous analytical results to identify any non-conforming work (see section 4.9 above).

5.5.8 Calibration Status of Equipment

Whenever practicable, all laboratory equipment requiring calibration is labelled, coded, or otherwise identified to indicate the status of calibration, including the date when last calibrated and the date or expiration criteria when recalibration is due. This requirement is mostly applicable to support equipment such as balances, mechanical pipettes, and temperature reading devices which require periodic calibration. Major analytical equipment that is calibrated and/or verified at time of use does not need to be labeled with its calibration status. Calibration records described in section 5.5.5 above are sufficient to indicate the calibration status.

5.5.9 Returned Equipment Checks

When, for whatever reason, equipment goes outside the direct control of the laboratory, the laboratory ensures that the function and calibration status of the equipment are checked and shown to be satisfactory before the equipment is returned to service.

5.5.10 Equipment Intermediate Checks

When intermediate checks are needed to maintain confidence in the calibration status of the equipment, these checks are carried out according to a defined procedure. These intermediate checks include continuing calibration verification checks performed on major analytical equipment, and also periodic checks of support equipment such as balances and pipettes.

5.5.11 Equipment Correction Factors

Where calibrations give rise to a set of correction factors, the laboratory has procedures to ensure that copies (e.g., in computer software) are correctly updated.

5.5.12 Safeguarding of Equipment Integrity

Analytical and supporting equipment is protected from inadvertent adjustments that could affect the integrity of the laboratory results. Instruments are located in access-protected areas. Software is tested and approved before use. Spreadsheets

used in the calculation of analytical results are tested, approved, and locked before being placed into service.

Table 5.5 General Equipment Calibration

Equipment	Activity	Frequency	Record Type
Balances	Verified with Class I NIST traceable weights when used	Daily, before use	Logbook – Located in each respective lab
Balances	• Clean • Check alignment • Service Contract Top-loading balances are allowed a tolerance of ±1%, while analytical balances are allowed a tolerance of ±0.1%.	At least once annually by a qualified vendor	Certificates from contractor.
Weights – Class I	• Only use for the intended purpose • Use plastic forceps to handle • Keep in case • Store in desiccator • Re-calibrate	Checked for accuracy by an external source, at least every 5 years, or sooner if necessary.	Certificates from contractor.
pH meters	Calibration: • pH buffer aliquot are used only once • Buffers used for calibration bracket the pH of the media, reagent, or sample analyzed. • Check must perform within 0.05 pH units. Temperature correction is performed either automatically by the instrument or manually depending upon the instrument used. Automatic temperature compensation probes are verified annually.	Before use	Calibrations are recorded in a logbook.
Automatic pipettes	Verify for accuracy and precision using reagent water and analytical balance	In-house – Monthly Contract – Semi Annually Tolerance is set at 2.0%, (ASTM standard = 3%).	Monthly verifications are recorded in a logbook. Semi-annual cal. is verified by certificates from the cal. service.
Refrigerators, Freezers, Hot plates and BOD incubators	• Thermometers are immersed in liquid to the appropriate immersion line • The thermometers are graduated in increments of 1°C or less • Temperature ranges are listed in app. SOPs	Temperatures are recorded each day in use	Logbook
Ovens	• Thermometers are immersed in sand to provide even measurement • The thermometers are graduated in increments of 1°C or less	Temperatures are recorded each day in use	Logbook

Table 5.5 General Equipment Calibration			
Equipment	**Activity**	**Frequency**	**Record Type**
Thermometers	ESC NIST-certified thermometers	Calibrated at least every 5 years, or sooner if necessary by a NIST calibration service, accredited to ISO/IEC 17025 and ANSI/NCSL Z540-1.	Calibration certificates from the calibration service.
	All working thermometers	Verified at least annually against NIST-certified thermometers by an outside service.	"Accuracy Assurance Program Test Data Sheets provided by the servicer. All thermometers are tagged with current tolerances. Internal daily checks are recorded in a logbook.
DO Meter	Calibrated according to manufacturer's specifications. Using the recorded temperature and barometric pressure the meter is calibrated to the air saturation of dissolved oxygen using a conversion chart provided by the manufacturer.	Before use	Calibration of each meter is recorded in a separate logbook.
Specific Conductivity Meter	The conductivity meter is calibrated according to manufacturer's specifications. Temperature correction is performed either automatically by the instrument or manually depending upon the instrument used. • Biomonitoring, potassium chloride with a conductivity value of 100 and 1000µmhos/cm is used as the calibration standard. • Wet Lab, potassium chloride with a value of 1413µmhos/cm is purchased from NSI for calibration purposes.	Before use	Calibration of each meter is recorded in separate daily logbooks.
Fume Hoods	Check quarterly and must meet the OSHA minimum recommended face velocity of 60 – 100fpm.	Quarterly	Electronic log

5.6 MEASUREMENT TRACEABILITY

5.6.1 General

All analytical equipment used, including support equipment, having a significant effect on the accuracy or validity of the result of the analysis, calibration or sampling is calibrated before being put into service. The laboratory has established procedures for the calibration and/or verification of this equipment. See the applicable analytical SOPs for more information.

5.6.2 Specific Requirements

The laboratory retains all pertinent information for standards, reagents, and chemicals to ensure that calibrations and measurements are traceable to a national standard. This includes documentation of purchase, receipt, preparation, and use. If traceability of measurements to a national standard is not possible or not relevant, evidence for correlation of results through inter-laboratory comparisons, proficiency testing, or independent analysis is provided.

5.6.3 Reference Standards and Reference Materials

Reference standards and materials are used to derive the laboratory's analytical measurements; therefore, it is essential that the reference standards and materials used are of very high quality.

5.6.3.1 Reference Standards

The laboratory uses ASTM Class 1 reference weights and NIST traceable reference thermometers which are calibrated and/or verified for accuracy by an ISO 17025 (or equivalent) accredited vendor that can provide traceability to national or international standards at a minimum frequency of every 5 years. All working thermometers are calibrated or verified at least annually using a NIST traceable thermometer.

5.6.3.2 Reference Materials

Whenever possible, reference materials must be purchased from a vendor that is accredited to ISO 17034 or Guide 34. Purchased reference materials require a Certificate of Analysis (COA) where available. If a reference material cannot be purchased with a Certificate of Analysis (COA), it must be verified by analysis and comparison to a certified reference material and/or there must be a demonstration of capability for characterization.

Upon receipt, all purchased reference material standards are recorded into a database and are assigned a unique identification number. Theses entries include

the chemical name, manufacturer name, manufacturer's identification numbers, receipt date, and expiration date. The vendor's certificates of analysis for all standards, reagents, or chemicals are retained for future reference.

Subsequent preparations of intermediate or working solutions are also recorded and given unique identification numbers. These entries include the stock standard identification, the solvent identification used for preparation, method of preparation, preparation date, expiration date, and the preparer's initials. The unique identification numbers of the reference material standards are used in any applicable sample preparation or analysis records so the standard can be traced back to the standard preparation record. This process ensures traceability back to the national standard.

5.6.3.3 Intermediate Checks

Reference material standards used for instrument calibration are verified by using a second source of the material. The second source materials are from a different manufacturer or different lot from the same manufacturer. Reference material standards are checked frequently and replaced if degradation or evaporation is suspected.

The laboratory also provides satisfactory evidence of correlation of results by participation in a suitable program of inter-laboratory comparisons or proficiency testing whenever possible.

5.6.3.4 Transport and Storage

The laboratory handles and transports reference standards and materials in a manner that protects the integrity of the materials. Reference standard and material integrity is protected by separation from incompatible materials and/or minimizing exposure to degrading environments or materials. Standards and reference materials are stored separately from samples, extracts, and digestates. All standards are stored according to the manufacturer's recommended conditions. Temperatures colder than the manufacturer's recommendation are acceptable if it does not compromise the integrity of the material (e.g. remains in liquid state and does not freeze solid). In the event a standard is made from more than a single source with different storage conditions, the standard will be stored according to the conditions specified in the analytical method.

See the applicable analytical SOPs for specific reference material storage protocols.

5.6.3.5 Documentation and Labeling

The laboratory retains records for all standards, reagents, and reference materials. These records include the manufacturer/vendor, the manufacturer's Certificate of Analysis or purity (if available), the date of receipt, and recommended storage conditions. These records also include manufacturer lot numbers when applicable.

For the original containers, the expiration date provided by the manufacturer is recorded on the container if the expiration date is not already present. If an expiration date is not provided then no expiration date labeling is required.

All prepared standard or reagent containers include the laboratory's unique identification number, the standard or chemical name, the date of preparation, the date of expiration, and the preparer's initials. For containers that are too small to accommodate labels that list all of the above information associated with a standard, the minimum required information will be the laboratory's unique identification number and expiration date. This assures that no standard will be used past its assigned expiration date.

Standards, reference materials, and reagents are not used after their expiration dates unless their reliability is thoroughly documented and verified by the laboratory. If a standard exceeds its expiration date and is not re-certified, the laboratory removes the standard and/or clearly designates it as acceptable for qualitative/troubleshooting purposes only. All prepared standards, reference materials, and reagents are verified to meet the requirements of the test method through routine analyses of quality control samples.

5.7 SAMPLING

5.7.1 Sampling Plans and Procedures

Sampling plans and written sampling procedures are used for sampling substances, materials, or products for testing. The sampling plans and procedures are made available at the sampling location. Sampling plans are, whenever reasonable, based on appropriate governing methods. The sampling process addresses the factors to be controlled to ensure the validity of the analytical results.

See Appendix III of this document for more information regarding field sampling protocols.

5.7.2 Customer Requested Deviations

When the customer requires deviations, additions, or exclusions from the documented laboratory sampling plan and/or procedure, these are recorded in

detail with the appropriate sampling data and are included in the final report. These deviations are also communicated to the appropriate laboratory personnel.

5.7.3 Sampling Records

Sampling records are maintained that include the sampling procedure used, any deviations from the procedure, the date and time of sampling, the identification of the sampler, environmental conditions (if relevant), and the sampling location.

See Appendix III of this document for more information regarding field sampling protocols.

5.7.4 Laboratory Subsampling

In order for analysis results to be representative of the sample collected in the field, the laboratory has subsampling procedures. For more information see SOP #030220, *Sample Homogenization*.

5.8 SAMPLE MANAGEMENT

5.8.1 Sample Management Procedures

Procedures have been established for the transportation, receipt, handling, protection, storage, retention, and disposal of samples. These procedures include provisions necessary to protect the integrity of the samples, and to protect the interests of the laboratory and our customers. For more information see the following SOPs; 060105 *Sample Receiving*, 060106 *Sample Storage and Disposal*, 060108 *Return Sample Shipping*, 060110 *Sample Shipping*, and 060112 *Cold Storage Management*.

5.8.1.1 Chain of Custody

A chain of custody (COC) provides documentation of the possession of samples from time of collection to receipt in the laboratory. This record generally includes: the number and types of containers; the mode of collection; the collector; time of collection; preservation; and requested analyses.

Laboratory field personnel or customer representatives must complete a chain of custody for all samples that are received by the laboratory. The importance of complete chain of custody records is stressed to the samplers and is critical to insure the requested methods are used to analyze the correct samples. If sample shipments are not accompanied by complete chain of custody records, then Sample Receiving personnel will notify applicable personnel in Customer Services. Customer services then obtains the correct documentation/information from the customer in order for the analysis of samples to proceed.

Chain of custody records are filled out completely and legibly with indelible ink. Errors are corrected by drawing a single line through the initial entry and initialing and dating the change. All transfers of samples are recorded on the chain of custody in the "relinquished and "received by sections.

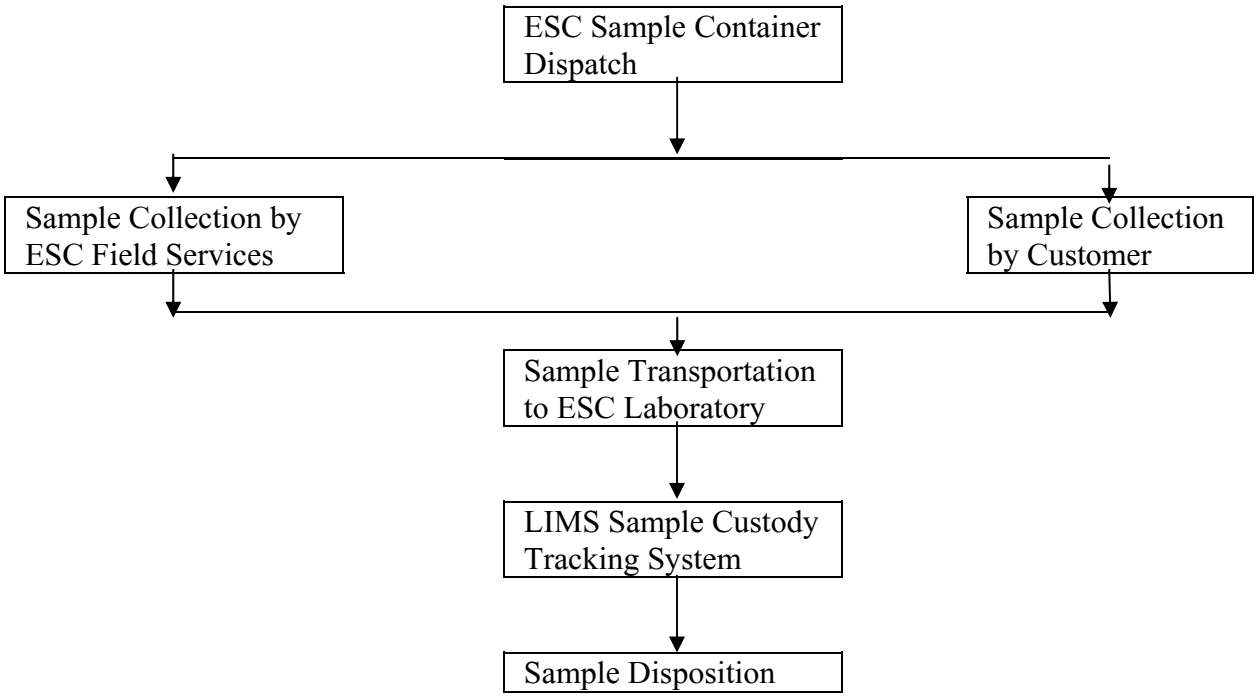
5.8.1.2 Legal Chain of Custody

Legal chain of custody procedures are performed at the special request of the customer, or if there are program requirements that mandate these procedures.

The legal chain of custody (COC) protocol establishes an intact, continuous record of the physical possession, storage, and disposal of samples. This includes the collected samples, sample aliquots, and sample extracts/digestates. Legal COC records account for all time periods associated with the samples, and identifies all individuals who physically handled individual samples. Legal COC shall begin at the point established by the federal or state oversight program. This may begin at the point that cleaned sample containers are provided by the laboratory or the time sample collection occurs.

Figure 5.8.1 below represents a flow diagram of the legal chain of custody process.

FIGURE 5.8.1
LEGAL CHAIN OF CUSTODY PROCESS



5.8.2 Sample Identification and Labeling

A unique sample identification number is generated for each sample submitted to the laboratory and is used throughout the analytical and disposal cycle. A record of all samples is established and maintained.

Each sample is assigned a unique and consecutive log number. After a sample is entered into the Laboratory Information Management System (LIMS) database it is assigned a specific log number identifier. The LIMS automatically assigns the next consecutive number any subsequent samples. Log numbers are not available for reuse and cannot be altered.

A durable laboratory sample label with the log number is printed from LIMS and is affixed to the sample. Each label contains a unique container ID, represents the sample ID number, and is clearly marked with preservative and requested analysis.

5.8.3 Sample Receipt, Inspection, and Login

Upon receipt of samples, departures from method or regulatory specified conditions are recorded. When these departures occur, the laboratory contacts the customer for further instructions before proceeding with the analysis. Records of these discussions are maintained.

5.8.3.1 Sample Acceptance Policy

In accordance with regulatory guidelines, ESC Lab Sciences complies with the following sample acceptance policy for all samples received.

If the samples do not meet the sample receipt acceptance criteria outlined below, the laboratory is required to document all non-compliances, contact the customer, and either reject the samples or fully document any decisions to proceed with analyses of samples which do not meet the criteria. Any results reported from samples not meeting these criteria are appropriately qualified on the final report.

All samples must:

- Have unique client identification that are clearly marked with durable waterproof labels on the sample containers and that match the chain of custody.
- Have clear documentation on the chain of custody related to the location of the sampling site with the time and date of sample collection.
- Have all requested analyses clearly designated on the COC.
- Be in appropriate sample containers with clear documentation of the preservatives used.
- Be correctly preserved unless the method allows for laboratory preservation.

- Be received within holding time. Any samples with hold times that are exceeded will not be processed without prior customer approval.
- Have sufficient sample volume to proceed with the analytical testing. If insufficient sample volume is received, analysis will not proceed without customer approval.
- Be received within appropriate temperature ranges (not frozen but ≤6°C) unless program requirements or customer contractual obligations mandate otherwise. The cooler temperature is recorded directly on the COC. Samples that are delivered to the laboratory immediately after collection are considered acceptable if there is evidence that the chilling process has been started. For example, by the arrival of the samples on ice. If samples arrive that are not compliant with these temperature requirements, the customer will be notified. The analysis will NOT proceed unless otherwise directed by the customer. If less than 72 hours remain in the hold time for the analysis, the analysis may be started while the customer is contacted to avoid missing the hold time. Data associated with any deviations from the above sample acceptance policy requirements will be appropriately qualified.

Samples for drinking water analysis that are improperly preserved, or are received past holding time, are rejected at the time of receipt, with the exception of VOA samples that are tested for pH at the time of analysis.

5.8.3.2 Sample Receipt and Inspection

All samples are verified upon receipt as meeting its description and being free from damage. In the event of a sample being lost, damaged or otherwise unsuitable for use, full details of the incident are recorded and reported to the customer by the Technical Service Representative via a nonconformance form, prior to any analytical action being taken. Any further action taken is at the direction of the customer.

Login Technicians are responsible for sample login and assessing sample container integrity, documentation, and identification. Samples are inspected and noted for temperature, pH using narrow-range pH paper, headspace, proper container type, container integrity (broken or leaking), and volume levels. Samples requiring thermal preservation at 4°C must arrive at the laboratory above freezing but ≤6°C. If the samples are not appropriately preserved, the problem is noted on a sample nonconformance form, the customer is notified, and, if the lab is instructed to proceed, proper preservation is performed. The sample nonconformance sheet becomes a permanent part of the COC. Samples, which require refrigeration, are placed in a laboratory cooler immediately after login.

Login Technicians are trained to recognize analyses with immediate, 24-hour, and 48-hour holding times. Those samples are designated as “short-holds . When

short-hold samples arrive at the laboratory, the Login procedure for those samples takes place immediately. All analysts are trained to assess incoming samples for holding time limitations.

If a sample has a holding time limitation, the LIMS issues a due date on the bench sheet to ensure that the extraction or analysis is completed within the time allowed. In the event that a holding time is exceeded, the TSR contacts the customer, informs them of the situation, and requests further direction. If instructed by the customer to proceed with the analysis, a qualifier is added to the benchsheet, which is then carried on to reporting. The final report bears the explanation in the form of a qualifier.

5.8.3.3 Nonconformance Issues

- If there are problems with the samples, the event details are documented on the sample nonconformance form/COC; then, the sampler and/or customer is notified.
- If the customer insists on proceeding with analyses, even with full knowledge of the possible invalidity of the sample, a qualifier detailing the problem is added in the LIMS and it is also noted on the nonconformance form.
- The TSR, affected chemists, and reporting personnel are also notified.

5.8.3.4 Sample Login

After sample inspection, all sample information on the chain of custody is entered into the Laboratory Information Management System (LIMS). This permanent record documents receipt of all sample containers including:

- Customer name and contact information
- The laboratory's unique sample identification numbers
- Sample descriptions
- Due dates
- List of analyses requested
- Date and time of laboratory receipt
- Field ID code
- Date and time of collection
- Any comments resulting from inspection for sample rejection

5.8.4 Sample Storage and Protection

The samples are stored according to method and regulatory requirements as per the applicable analytical SOPs. While in storage, samples are stored by sample ID and analyses required. Samples are stored away from all standards, reagents, or other potential sources of contamination. Samples are stored in a manner that

prevents cross contamination. Volatile samples are stored separately from other samples. All sample fractions, extracts, leachates, and other sample preparation products are stored in the same manner as actual samples or as specified by the analytical method.

Refrigerated storage areas are maintained at ≤6°C (but not frozen) and freezer storage areas are maintained at <-10°C (unless otherwise required per method or program). The temperature of each storage area is checked and documented at least once for each day of use. If the temperature falls outside the acceptable limits, then corrective actions are taken and appropriately documented.

The laboratory is operated under controlled access protocols to ensure sample and data integrity. Visitors must register at the front desk and be properly escorted at all times. Samples are taken to the appropriate storage location immediately after sample receipt and login procedures are completed. All sample storage areas have limited access. Samples are removed from storage areas by designated personnel and returned to the storage areas as soon as possible after the required sample quantity has been taken.

5.8.4.1 Sample Retention and Disposal

Samples, extracts, digestates, and leachates are retained by the laboratory for the period of time necessary to protect the interests of the laboratory and the customer. Unused portions of samples are retained by the laboratory based on program or customer requirements for sample retention and storage. The minimum sample retention time is 45 days after sample receipt. Samples may be stored at ambient temperature when all analyses are complete, the hold time is expired, the report has been delivered, and/or allowed by the customer or program. Samples requiring storage beyond the minimum sample retention time due to special requests or contractual obligations may be stored at ambient temperature unless the laboratory has sufficient capacity and their presence does not compromise the integrity of other samples.

After this period expires, non-hazardous samples are properly disposed of as non-hazardous waste. The preferred method for disposition of hazardous samples is to return the excess sample to the customer. If it is not feasible to return samples, or the customer requires the laboratory to dispose of excess samples, proper arrangements will be made for disposal by an approved contractor.

For more information about sample storage and disposal see Section 6 of this document, SOP #060106, *Sample Storage and Disposal*, and SOP #060112, *Cold Storage Management*.

5.9 QUALITY CONTROL

5.9.1 Quality Control Procedures

ESC Lab Sciences has established quality control procedures for monitoring the validity of the testing it performs. Quality control samples are processed in the same manner as customer samples. The quality control results are recorded in such a way that trends are detectable, and where practicable, are statistically evaluated. This monitoring is planned and reviewed, and includes the utilization of certified reference materials (where available), participation in proficiency testing programs, replicate or confirmation analyses, correlation of results from related analyses, comparison to historical data, etc.

5.9.2 Quality Control Evaluation

The quality control data is evaluated and, when found to be outside pre-defined criteria, action is taken to correct the problem and to prevent incorrect results from being reported. For more information see the applicable analytical SOPs.

5.9.3 Essential Quality Control Procedures

Below are some general essential quality control procedures used in the laboratory. Additional information can be found in the applicable analytical SOPs.

5.9.3.1 Initial Calibration Verification (ICV) or Second Source Verification (SSV)

It is possible for a calibration curve to meet method criteria but still not have the ability to obtain accurate results because all calibration points are from the same source. To assess the accuracy of new calibration curves relative to the purity of the standards, a single standard from a secondary source is analyzed. This secondary source must be from an alternative vendor or from a different lot if the same vendor is used for the preparation of the calibration standards. The laboratory follows specific guidelines for ICV/SSV recoveries and further information can be found in the applicable laboratory SOP.

5.9.3.2 Continuing Calibration Verification (CCV)

Analytical instrumentation is checked periodically to determine if the analytical response has changed significantly since the initial calibration was established. The values obtained from the analysis of the CCV are compared to the true values and a percent change calculated. The laboratory follows specific guidelines for CCV frequency and recoveries. Further information can be found in the applicable laboratory SOP.

5.9.3.3 Method Blank

A method blank is used to evaluate contamination in the preparation/analysis system and is processed through all preparation and analytical steps with its associated samples. A method blank is processed at a minimum frequency of one per batch of up to twenty samples.

The method blank consists of a matrix similar to the associated samples that is known to be free of analytes of interest. Method blanks are not applicable for certain analyses, such as pH, conductivity, flash point and temperature.

Each method blank is evaluated for contamination. The source of any contamination is investigated and documented corrective action is taken when the concentration of any target analyte is detected above the reporting limit and is greater than 1/10 of the amount of that analyte found in any associated sample. Some programs may require evaluating their method blanks down to ½ the reporting limit as opposed to the reporting limit itself. Corrective actions for blank contamination may include the re-preparation and re-analysis of all samples (where possible) and quality control samples. Data qualifiers must be applied to results that are considered affected by contamination in a method blank.

5.9.3.4 Laboratory Control Sample

The Laboratory Control Sample (LCS) is used to evaluate the performance of the entire analytical system including preparation and analysis. An LCS is processed at a minimum frequency of one per batch of up to twenty samples.

The LCS consists of a matrix similar to the associated samples that is known to be free of the analytes of interest that is then spiked with known concentrations of target analytes. An LCS is not applicable for certain analyses where spiking procedures are not practical such as dissolved oxygen, odor, and temperature.

The LCS is evaluated against the method default or laboratory-derived acceptance criteria. Any compound that is outside of these limits is considered to be 'out of control' and must be qualified appropriately. Any associated sample containing an 'out-of-control' compound must either be re-analyzed with a successful LCS or reported with the appropriate data qualifier. An exception to this is when the acceptance criteria for the LCS are exceeded high and there are associated samples that are non-detects, then those non-detects can be reported. Another exception is when the acceptance criteria are exceeded low, those associated sample results may be reported if they exceed the maximum regulatory limit or decision level.

For LCSs containing a large number of analytes, it is statistically likely that a few recoveries will be outside of control limits. This does not necessarily mean that the

system is out of control, and therefore no corrective action would be necessary (except for proper documentation). TNI has allowed for a minimum number of marginal exceedances, defined as recoveries that are beyond the LCS control limits (3X the standard deviation) but less than the marginal exceedance limits (4X the standard deviation). The number of allowable exceedances depends on the number of compounds in the LCS. If more analyte recoveries exceed the LCS control limits than is allowed (see below) or if any one analyte exceeds the marginal exceedance limits, then the LCS is considered non-compliant and corrective actions are necessary. The number of allowable exceedances is as follows:

Number of Target Analytes	**Allowable Marginal Exceedance Outliers**
>90	5 analytes allowed in the ME limit
71-90	4 analytes allowed in the ME limit
51-70	3 analytes allowed in the ME limit
31-50	2 analytes allowed in the ME limit
11-30	1 analytes allowed in the ME limit
<10	0 analytes allowed in the ME limit

5.9.3.5 Matrix Spike

A matrix spike (MS) is used to determine the effect of the sample matrix on compound recovery for a particular method. The information from these spikes is sample or matrix specific and is not used to determine the acceptance of an entire batch. A MS consists of the sample matrix that is then spiked with known concentrations of target analytes.

A Matrix Spike/Matrix Spike Duplicate (MS/MSD) set is processed at a frequency specified in the applicable laboratory SOP or as determined by a specific customer request. Typically, an MS/MSD set is analyzed once per batch of up to twenty samples.

The MS/MSD set is evaluated against the method or laboratory derived criteria. Any compound that is outside of these limits is considered to be 'out of control' and must be qualified appropriately. Batch acceptance, however, is based on method blank and LCS performance, not on MS/MSD recoveries. The spike recoveries give the data user a better understanding of the final results based on their site specific information.

5.9.3.6 Sample Duplicate

A sample duplicate is a second portion of sample that is prepared and analyzed in the laboratory along with the first portion. It is used to measure the precision associated with preparation and analysis. A sample duplicate is processed at a

frequency specified by the particular method or as determined by a specific customer.

The sample and duplicate are evaluated against the method or laboratory derived criteria for relative percent difference (RPD). Any duplicate that is outside of these limits is considered to be 'out of control' and must be qualified appropriately.

5.9.3.7 Surrogates

Surrogates are compounds that reflect the chemistry of target analytes, but are not expected to occur naturally in field samples. The purpose of the surrogates is to assess sample preparation, analytical efficiency, and to monitor the effect of the sample matrix on compound recovery.

The surrogates are evaluated against the method or laboratory derived acceptance criteria or against project-specific acceptance criteria specified by the customer. Any surrogate compound that is outside of these limits is considered to be 'out of control' and must be qualified appropriately. Samples with surrogate failures can be re-extracted and/or re-analyzed to confirm that the out-of-control value was caused by the matrix of the sample and not by some other systematic error.

5.9.3.8 Internal Standards

Internal Standards are compounds not expected to occur naturally in field samples. They are added to every standard and sample at a known concentration prior to analysis for the purpose of adjusting the response factor used in quantifying target analytes. The laboratory follows specific guidelines for the treatment of internal standard recoveries and further information can be found in the applicable laboratory SOP.

5.9.3.9 Proficiency Testing (PT) Studies

The laboratory participates in proficiency testing programs. PT samples are obtained from approved providers and analyzed and reported at a minimum of two times per year for the relevant fields of testing per matrix. PT samples are treated as typical customer samples. They are included in the laboratory's normal analytical processes and do not receive extraordinary attention due to their nature.

The laboratory does not share PT samples with other laboratories, does not communicate with other laboratories regarding current PT sample results, and does not attempt to obtain the assigned value of any PT sample from the PT provider.

The laboratory initiates an investigation and corrective action plan whenever PT results are deemed unacceptable by the PT provider. Additional PTs will be analyzed and reported as needed for certification purposes.

Additional information can be found in the SOP# 030212, *Proficiency Testing Program*

5.10 DATA REPORTING

5.10.1 General

The results of each analysis carried out by the laboratory are reported accurately, clearly, unambiguously, objectively, and in accordance with any specific instructions in regulatory requirements, analytical method(s), and/or laboratory standard operating procedures. The analytical data is reported in an analytical report that is issued to the customer. Analytical reports include all information requested by the customer, any necessary information for the interpretation of the results, and all information required by the analytical method(s) used.

Final reports are prepared according to the level of reporting required by the customer and can be transmitted to the customer via hardcopy and/or electronic data deliverables.

5.10.2 Analytical Reports

In the case of a written agreement with the customer, the analytical results may be reported in a non-standard way. In these cases, all information contained in the standard analytical reports is maintained by the laboratory and is readily available.

Standard analytical reports contain the following information:

- A title (e.g. Analytical Report)
- ESC Lab Sciences name and address
- Telephone number and name of a laboratory contact to where questions can be referred
- A unique identification number for the report. The pages of the report are numbered and a total number of pages are indicated.
- Name and address of the customer
- Identification of the analytical methods used
- The unique laboratory's identification of the samples analyzed as well as customer's identification of the samples
- The condition of the samples received and the identification of any sample that did not meet acceptable sampling requirements such as improper sample containers, holding times missed, sample temperature, etc.
- Dates and times of sample collection, sample receipt by the laboratory, sample preparation, and sample analysis
- Reference to the sampling plan and sampling procedures used if sampling was conducted by the laboratory

- The analytical results with the units of measurement and reporting limits.
- The name, title, and signature of the person authorizing the analytical report
- A statement about the results relate only to the items tested
- Deviations from the analytical methods. These can include failed quality control parameters, deviations caused by the matrix of the sample, etc. This can be part of the case narrative or as defined footnotes to the analytical data.
- For Whole Effluent Toxicity, identification of the statistical method used to provide data
- Date report was issued
- For solid samples, identification of whether results are on a dry weight or wet weight basis
- Identification of all test results provided by a subcontracted laboratory or other outside source
- Any non-accredited tests are identified as such
- Identification of results obtained outside of quantitation levels
- In conjunction with Ohio VAP projects, a signed affidavit is also required.

5.10.3 Additional Analytical Report Items

In addition to the requirements listed above, final reports also contain the following items when necessary for the interpretation of results:

- Deviations from, additions to, or exclusions from the analytical method(s) used. Also where relevant, information on specific analytical conditions such as environmental conditions
- Where relevant, a statement of compliance/non-compliance with requirements and/or specifications (e.g. TNI Standard)
- Where applicable, a statement on the estimated uncertainty of measurement; information on uncertainty is needed in test reports when it is relevant to the validity or application of the test results, when a customer's instruction so requires, or when the uncertainty affects compliance to a specification limit;
- Where appropriate and needed, opinions and interpretations (see section 5.10.5 below)

In addition to the requirements listed above, analytical reports containing the results of samples collected by the laboratory include the following, where necessary for the interpretation of test results:

- The date of sampling
- Unambiguous identification of the substance, material or product sampled
- The location of sampling, including any diagrams, sketches or photographs
- A reference to the sampling plan and procedures used

- Details of any environmental conditions during sampling that may affect the interpretation of the test results
- Any standard or other specification for the sampling method or procedure, and deviations, additions to or exclusions from the specification concerned.

5.10.4 Calibration Certificates

ESC Lab Sciences is an analytical laboratory that does not perform calibration activities for customers; therefore, no calibration certificates are issued to customers.

5.10.5 Opinions and Interpretations

When opinions and interpretations are included in the analytical reports, the laboratory documents the basis upon which the opinions and interpretations have been made. These may include opinions on the compliance/non-compliance of the results with regulatory requirements, fulfillment of contractual requirements, and recommendations on how to use the results. Opinions and interpretations are clearly marked as such in the analytical report and are contained in the case narrative.

5.10.6 Results from Subcontractors

When the analytical reports contain results of tests performed by subcontractors, these results are clearly identified. When analytical work has been subcontracted, the subcontracted laboratory issues analytical reports to ESC Lab Sciences in writing and/or electronically. Copies of analytical reports from subcontracted laboratories are made available to customers.

5.10.7 Electronic Transmission of Results

Customer data that requires transmission by electronic means undergoes appropriate steps to include all the required reporting information and to adequately maintain data integrity and confidentiality.

5.10.8 Format of Analytical Reports

The format of the laboratory's analytical reports are designed to accommodate each type of analytical test carried out by the laboratory and to minimize the possibility of misunderstanding or misuse of analytical results.

5.10.9 Amendments to Analytical Reports

Analytical reports that are amended after issue to the customer are clearly identified as such and include a reference to the original report. This process is described in SOP 030223, *Report Revision*.

6.0 WASTE MINIMIZATION/DISPOSAL AND REAGENT STORAGE

ESC's sample disposal policy is founded on RCRA [40 CFR Part 261.4 (d)] and CWA [40 CFR Part 403 (Pretreatment)]. Part 261.4 (Figure 6.4) excludes a sample of waste while it is a sample; however, once no longer fitting the description of a sample, it becomes waste again. The policy is further strengthened by information found in "Less is Better" published by the ACS and developed by the ACS Task Force on RCRA.

The EPA requires that laboratory waste management practice to be conducted consistent with all applicable rules and regulations. Excess reagents, samples and method process wastes must be characterized and disposed of in an acceptable manner. Refer to ESC SOP #030309, *Waste Management Plan* for detailed information.

6.1 QUARANTINED SOIL SAMPLES

ESC maintains a permit to receive and analyze soils from foreign or quarantined areas. All non-hazardous soil samples are disposed of as originating from a quarantined area. All unconsumed soil samples and containers are sterilized in accordance with the current USDA regulations found in 7 CFR 301.81. Both container and contents are dry-heated at 450°F for two minutes, then crushed prior to disposal into a sanitary landfill. For further information refer to SOP# 030309, *Waste Management Plan*.

6.2 MOLD/BIOHAZARD SAMPLE DISPOSAL

The laboratory has contracted a local licensed medical waste removal and disposal firm to remove all biohazard and medical waste generated by the laboratory. All waste arriving at the treatment facility is incinerated or steam sterilized complying with all Federal, State, County and local rules, regulations and ordinances. The medical waste containers are picked up at least weekly and confirmation records are available in the laboratory.

All wastes classified as non-biohazard are disposed of via the sanitary sewer following treatment with a disinfectant, such as Chlorox (hypochlorite). The disinfectant and waste liquid is one part disinfectant and five parts waste liquid. Waste disposal records indicating the disposal method are available in the laboratory.

6.3 REAGENTS, STORAGE AND WASTE DISPOSAL

6.3.1 Reagents:

- All chemicals are at least ACS reagent-grade or better.
- All reagents and chemicals are checked for quality, purity and acceptability upon arrival in the laboratory.
- Each chemical container displays the following information: date opened and the expiration date.

- All reagent solutions prepared in-house are documented in Standards Logger and labels contain the following information: unique ESC identifier, date prepared, analyst initials, expiration date, and reagent name. In house reagents are recorded with the same information in Standards Logger.
- Purchased reagent solutions are labeled with a unique identifier assigned in Standards Logger when received, opened and with the expiration date.

6.3.2 Storage:

- Reagents requiring refrigeration are stored in the area of use in a suitable refrigerated storage that is separate from field sample storage.
- Reagents and standards used for volatile organic analysis are stored in a separate refrigerator and are not stored with field samples.
- See the following table for more information regarding reagent storage.

Item	**Reagent Storage**
Acids	Designated acid storage cabinets, in original container.
Organic Reagents - Flammables	Stored in flammables cabinet on separate air handling system from volatiles analysis.
Liquid Bases	Stored in designated cabinet, away from acids.
Solid Reagents	General cabinet storage.
Refrigerated Aqueous Reagents/Standards	Stored in walk-in cooler on designated shelves, away from field samples.
Stable Standard Solutions	Storage cabinet designated in each laboratory for standards.
Dehydrated Media	Dehydrated media is stored at an even temperature in a cool dry place away from direct sunlight. Media is discarded if it begins to cake, discolor, or show signs of deterioration. If the manufacturer establishes an expiration date, the media is discarded after that date. The time limit for unopened bottles is 2 years at room temperature. Where needed comparisons of recovery of newly purchased lots of media against proven lots, using recent pure-culture isolates and natural samples, are performed.
Pure Biological Cultures	All organisms are stored on Tryptic Soy Agar at 4°C in a dedicated refrigerator located in the biology department

6.3.3 Disposal:

- All excess, out of date or unneeded chemicals, reagents and standards are sent to the ESSH Office to ensure proper disposal. Excess chemicals designated as hazardous waste are lab packed and disposed of according to local, State and Federal regulations. Final disposal method is dependant on the classification of each individual chemical. Some sample extracts, chemicals or standards designated as hazardous waste may be disposed of into appropriate satellite accumulation areas.

Any additional EPA waste codes resulting from addition of standard are applied to the satellite container, if applicable.

- ESSH prohibits the sink disposal of chemicals, the intentional release of chemicals through chemical fume hoods and mixing of nonhazardous lab trash with hazardous waste.
- Sample and reagent/solvent disposal is handled in different ways according to toxicity.
  - Solvents, reagents, samples and wastes are segregated according to base/acid, reactive/non-reactive, flammable/non-flammable, hazardous/non-hazardous, soil/liquid etc. Samples are grouped together relevant to these categories and are disposed of accordingly.
  - Table 6.3 lists waste disposal methods for various test by-products.
- Upon receipt and login, each sample is coded by sample matrix type. The codes divide samples into the following groups: air, industrial hygiene, wastewater, cake sludge, soil, drinking water and miscellaneous. As laboratory personnel review the data reported, the method of disposal is also determined.
- The TSR is notified if samples are to be returned to the customer.

6.4 CONTAMINATION CONTROL

6.4.1 VOCs

The VOC Lab is physically separated from the Extraction Laboratory in order to eliminate contamination caused by the use of extraction solvents. Contamination is monitored daily through the use of instrument/method blanks. Refrigerator blanks are also used to ensure that cross contamination does not occur during volatile field sample storage.

6.4.2 Biological Lab

The aquatic toxicity testing, mold testing, and all other biological determinations are performed in the administrative building and are therefore physically separated from processes involving solvent or other chemical use that could negatively impact biological organisms. The mold lab conducts monthly analyses to ensure that the laboratory environment is contaminant free. All critical areas are included and a record is kept of the sampling plan (including locations) and results.

TABLE 6.4 - WASTE DISPOSAL

NOTE: This information is a general guide and is not intended to be inclusive of all waste or hazardous samples.

PARAMETER	WASTE PRODUCTS	WASTE CLASSIFICATION	DISPOSAL METHOD
Acidity	slightly alkaline water	none	neutralize-sanitary sewer
Alkalinity	slightly acidic	none	neutralize-sanitary sewer
BOD, 5-day	Sample waste only	none	sanitary sewer
COD	acid waste, Hg, Ag, Cr+6	corrosive, toxic	dispose via haz waste regulations
Conductivity	Sample waste only	none	sanitary sewer
Cyanide, Total	acidic waste	corrosive	neutralize-sanitary sewer
Cyanide, Amenable	acidic waste	corrosive	neutralize-sanitary sewer
Flashpoint	Misc. Organic waste containing Chlorobenzene	Flammable	Dispose via haz waste regulations
Hardness, Total	pH 10.0 alkaline waste	none	neutralize-sanitary sewer
Extraction/prep	methylene chloride and hexane	toxic solvents	Reclaim for resale
Methylene Blue Active Sub.	Acidic Chloroform Waste	toxic & acidic	dispose via haz waste regulations
Nitrogen-Ammonia	alkaline liquids	corrosive	neutralize-sanitary sewer
Nitrogen-Total Kjeldahl	Trace Hg in alkaline liquid	corrosive toxic	neutralize-sanitary sewer
Nitrogen-Nitrate, Nitrite	mild alkaline waste	none	sanitary sewer
Oil & Grease and Petroleum/Mineral Oil & Grease	Hexane	Toxic solvent	dispose via haz waste regulations
pH	Sample waste only	none	sanitary sewer
Phenols	slightly alkaline, non-amenable CN-	none	sanitary sewer
Phosphate-Total and Ortho	combined reagent	listed	sanitary sewer
Reactive CN & S	Acidic waste	corrosive	Neutralize - sanitary sewer; waste is monitored for CN
Solids, Total/ Suspended/Dissolved	Sample waste only	none	sanitary sewer
Turbidity	Sample waste only	none	sanitary sewer
Metals	acids, metal solutions	corrosive, toxic	highly toxic metal standards and samples - dispose via haz waste regulations
Volatile Organics	methanol	toxic solvents	dispose via haz waste regulations
Extractable Organics	solvents, standards	toxic solvents	dispose via haz waste regulations
Biological Non-biohazardous Waste	Gloves, plastic containers	none	Standard refuse

40 CFR PART 261-IDENTIFICATION AND LISTING OF HAZARDOUS WASTE

Subpart A-General Sec.

261.1 Purpose and scope.
261.2 Definition of solid waste.
261.3 Definition of hazardous waste.

261.4 Exclusions.
261.5 Special requirements for hazardous waste generated by conditionally exempt small quantity generators.
261.6 Requirements for recyclable materials.
261.7 Residues of hazardous waste in empty containers.
261.8 PCB wastes regulated under Toxic Substance Control Act.
261.9 Requirements for Universal Waste.

Sec.261.4 Exclusions.
(d) *Samples.* (1) Except as provided in paragraph (d)(2) of this section, a sample of solid waste or a sample of water, soil, or air, which is collected for the sole purpose of testing to determine its characteristics or composition, is not subject to any requirements of this part or parts 262 through 268 or part 270 or part 124 of this chapter or to the notification requirements of section 3010 of RCRA, when:

(i) The sample is being transported to a laboratory for the purpose of testing; or
(ii) The sample is being transported back to the sample collector after testing; or
(iii) The sample is being stored by the sample collector before transport to a laboratory for testing; or
(iv) The sample is being stored in a laboratory before testing; or
(v) The sample is being stored in a laboratory after testing but before it is returned to the sample collector; or
(vi) The sample is being stored temporarily in the laboratory after testing for a specific purpose (for example, until conclusion of a court case or enforcement action where further testing of the sample may be necessary).
(2) In order to qualify for the exemption in paragraphs (d)(1) (i) and (ii) of this section, a sample collector shipping samples to a laboratory and a laboratory returning samples to a sample collector must:
(i) Comply with U.S. Department of Transportation (DOT), U.S. Postal Service (USPS), or any other applicable shipping requirements; or
(ii) Comply with the following requirements if the sample collector determines that DOT, USPS, or other shipping requirements do not apply to the shipment of the sample:
(A) Assure that the following information accompanies the sample:
(*1*) The sample collector's name, mailing address, and telephone number;
(*2*) The laboratory's name, mailing address, and telephone number;
(*3*) The quantity of the sample;
(*4*) The date of shipment; and
(*5*) A description of the sample.
(B) Package the sample so that it does not leak, spill, or vaporize from its packaging.
(3) This exemption does not apply if the laboratory determines that the waste is hazardous but the laboratory is no longer meeting any of the conditions stated in paragraph (d)(1) of this section.

7.0 Common Calculations

- Percent Recovery (%REC)

$$\%REC = \frac{(MeasuredValue - SampleConc)}{TrueValue} * 100$$

where:
TrueValue = Amount spiked
MeasuredValue = Amount measured
SampleConc = Amount measured in source sample (Used for %REC in MS calculations)
NOTE: The SampleConc is zero (0) for LCS and Surrogate Calculations

- Relative Percent Difference (RPD)

$$RPD = \frac{|(R1 - R2)|}{(R1 + R2)/2} * 100$$

where:
R1 = Result of Sample 1
R2 = Result of Sample 2

- Percent Difference (%D)

$$\%D = \frac{MeasuredValue - TrueValue}{TrueValue} * 100$$

where:
TrueValue = Amount spiked (can also be the CF or RF of the ICAL Standards)
Measured Value = Amount measured (can also be the CF or RF of the CCV)

- Percent Drift

$$\%Drift = \frac{CalculatedConcentration - TheoreticalConcentration}{TheoreticalConcentrtion} * 100$$

- Average

$$Average = \frac{\sum_{n=1}^{i} X_i}{n}$$

where:
n = number of data points
X_i = individual data point

- Calibration Factor (CF)

$$CF = \frac{A_s}{C_s}$$

where:
A_s = Average Peak Area over the number of peaks used for quantitation
C_s = Concentration of the analyte in the standard.

- Response Factor (RF)

$$RF = \frac{(Conc._{IStd})(Area_{Analyte})}{(Conc._{analyte})(Area_{IStd})}$$

where:
A_s = Response for analyte to be measured
A_{is} = Response for the internal standard
C_{is} = Concentration of the internal standard
C_s = Concentration of the analyte to be measured

- Standard Deviation (S)

$$S = \sqrt{\sum_{i=1}^{n} \frac{(X_i - X_{ave})^2}{(n-1)}}$$

where:
n = number of data points
X_i = individual data point
X_{ave} = average of all data points

- Relative Standard Deviation (RSD)

$$RSD = \frac{S}{X_{ave}} * 100$$

where:
S = Standard Deviation of the data points
X_{ave} = average of all data points

- Minimum Detectable Activity (MDA)

  The MDA is used for radiological analysis and is calculated with the following equations:

  MDA with Blank Population

$$MDA = \frac{3.29 \times S_b}{KT_s} + \frac{3}{KT_s}$$

  Where:
  K = E × V × R × Y × F × 2.22
  E = efficiency
  V = sample volume
  R = tracer recovery
  Y = gravimetric carrier recovery
  F = ingrowth or decay factor
  2.22 = conversion from dpm to pCi
  T_s = count time of sample in minutes
  S_b = standard deviation of the blank population

  MDA without Blank Population

$$MDA = \frac{3.29 \times \sqrt{\frac{b}{T_s} + \frac{b}{T_b}}}{K} + \frac{3}{KT_s}$$

  Where:
  b = background count rate in cpm
  T_b = Count time of background in minutes

8.0 Revisions

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of the Quality Assurance Manual are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0	General – Replaced the term "client" with the term "customer" throughout this document. Also changed references to AIHA to AIHA-LAP or AIHA-PAT as appropriate. Section 1.0 – Limited scope of this section to just a general purpose. Removed Index and Revision Status section. Section 2.2 – Updated the current number of employees, the current square footage, and the current number of buildings. Section 3.3 – Added definitions of the TX TRRP terms SQL, MQL, and Unadj. MQL. Added air and emissions to the definition of Environmental Sample. Added definitions of SUMMA canisters and Tedlar bags. Section 3.4 – Added the descriptions of abbreviations AIHA-LAP and AIHA-PAT. Section 4.1.4 – Reworded section for clarity Section 4.1.5 – Reworded section for clarity Section 4.1.6 – Reworded section for clarity Figure 4.1 – Updated Org Chart Section 4.2 – Reworded entire section for clarity Section 4.2.2 – Rewrote the quality policy statement Section 4.2.6 – Renamed Lab Director to Director of Operations and reworded responsibilities. Removed Technical Director. Added Organics Manager and Inorganics Manager. Renamed QA Manager to QA Director. Section 4.2.8 – Added Data Integrity System section Section 4.3 – Reworded entire section for clarity Section 4.3.4 – Added section for Quality Assurance Manual which was previously in 4.2.4 Section 4.4.1 – Added some language about review of routine/non-complex projects Section 4.4.3 – Reworded section for clarity Section 4.5.5 – Added Identification of Sub Work section. Language was previously in 4.5.3 Section 4.6.2 – Reworded section for clarity Section 4.6.3 – Reworded section for clarity Section 4.7 – Reworded some subsections for clarity Section 4.8 – Reworded entire section for clarity Section 4.9 – Reworded entire section for clarity Section 4.10 – Reworded entire section for clarity Section 4.11 – Reworded entire section for clarity Section 4.12 – Reworded entire section for clarity Section 4.14 – Reworded entire section for clarity Section 4.15 – Reworded entire section for clarity Section 5.2.2 – Reworded entire section for clarity Section 5.2.2.4 – Added section for data integrity training Section 5.2.2.5 – Added section for identification of training needs Section 5.2.2.6 – Added section for evaluation of training effectiveness Section 5.2.3 – Reworded section for clarity Section 5.2.5 – Reworded section for clarity Section 5.3.2 – Reworded section for clarity Section 5.3.3 – Reworded section for clarity Section 5.3.4 – Reworded section for clarity Section 5.4.5.4 – Reworded section for clarity Section 5.4.5.5 – Reworded section for clarity Section 5.4.6 – Reworded section for clarity Section 5.4.7.1 – Reworded section for clarity

Document	Revision
	Section 5.4.7.2 – Added in some DoD required items Section 5.4.7.3 – Added data reduction and review section. Language was previously in section 5.11 and section 5.12 Table 5.4.7a – Revised the levels of LIMS security Section 5.5 – Reworded entire section for clarity Section 5.5.2 – Added appropriate calibration curve models, quadratic curve evaluation, and added language about higher order polynomial curves (i.e., third-order and greater) are not allowed at ESC. Section 5.6 – Reworded entire section for clarity Section 5.7 – Reworded entire section for clarity Section 5.7.4 – Added section for laboratory subsampling Section 5.8 – Reorganized and reworded entire section for clarity 5.8.3.1 – Revised Sample Rejection Policy to a Sample Acceptance Policy and changed the criteria that needs to be met. Section 5.9.1 – Reworded section for clarity Section 5.9.2 – Reworded section for clarity Section 5.10 – Reworded entire section for clarity Section 6.4 – Removed language about wipe testing in Metals for lead Section 7 – Added calculations for MDA used in radiological analysis

NOTE: The QAM has been approved by the following people.

Eric Johnson, B.S., Director of Operations 615-773-9654

Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Director, 615-773-9684

Bill Mock, B.S., Technical Services Manager, 615-773-7551

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This appendix discusses the standard practices and procedures utilized by ESC personnel for site selection and sample collection of various matrices. Topics addressed include field QA/QC procedures, together with equipment care and calibration for field sampling activities. Proper collection and handling of samples is of the utmost importance to insure that collected samples are representative of the sampling site. With this goal, proper sampling, handling, preservation, and quality control techniques for each matrix must be established and strictly followed. Precise identification of the collected samples and complete field documentation including a chain of custody are also vital.

ESC Lab Sciences does not provide sampling services for Industrial Hygiene and Environmental Lead analyses. We do require that all samples collected for these programs be sampled using the guidelines established by NIOSH, OSHA or other published protocol.

In addition, ESC Lab Sciences personnel do not conduct sampling in conjunction with the Ohio Voluntary Action Program (VAP).

4.0 LIST OF SAMPLING CAPABILITIES

• **Parameter Group**	• **Sample Source**
Extractable Organics	Surface water, wastewater, groundwater, stormwater runoff, drinking water, sediments, soils, chemical/ hazardous wastes, domestic wastewater sludge, hazardous waste sludge
Volatile Organic Compounds (VOCs)	Surface water, wastewater, groundwater, stormwater runoff, drinking water, sediments, soils, chemical/ hazardous wastes, domestic wastewater sludge, hazardous waste sludge
Metals	Surface water, wastewater, groundwater, stormwater runoff, drinking water, sediments, soils, chemical/ hazardous wastes, domestic wastewater sludge, hazardous waste sludge
Inorganic Anions	Surface water, wastewater, groundwater, stormwater runoff, drinking water, sediments, soils, chemical/ hazardous wastes, domestic wastewater sludge, hazardous waste sludge
Organics	Surface water, wastewater, groundwater, stormwater runoff, drinking water, sediments, soils, chemical/ hazardous wastes, domestic wastewater sludge, hazardous waste sludge
Physical Properties	Surface water, wastewater, groundwater, stormwater runoff, drinking water, sediments, soils, chemical/ hazardous wastes, domestic wastewater sludge, hazardous waste sludge
Cyanide	Surface water, wastewater, groundwater, stormwater runoff, drinking water, sediments, soils, chemical/ hazardous wastes, domestic wastewater sludge, hazardous waste sludge

• Parameter Group	• Sample Source
Microbiology	Surface water, groundwater, drinking water, wastewater
Macro Invertebrate Identification	Surface water, wastewater, sediments
Biotoxicity	Surface water and wastewater

5.0 GENERAL CONSIDERATIONS

The following procedures are used in all of ESC's sampling activities. These procedures must be considered in relation to the objectives and scope of each sampling event.

5.1 SELECTING A REPRESENTATIVE SAMPLING SITE

Selecting a representative sampling site is dependent upon the matrix to be sampled and type of analyses required. These matrix specific procedures are discussed in subsequent sections.

5.2 SELECTION AND PROPER PREPARATION OF SAMPLING EQUIPMENT

The type of sampling equipment to be used is specific to the sample matrix and the analyses to be conducted. These are discussed later in this section. Section 12.0 describes the equipment cleaning procedures utilized by ESC personnel.

5.3 SAMPLING PROCEDURES FOR INDUSTRIAL HYGIENE AND ENVIRONMENTAL LEAD SAMPLES

ESC does not provide sampling services for industrial hygiene and/or environmental lead analyses. Experienced laboratory personnel can assist with advice on sampling; however, the adequacy and accuracy of sample collection is the customer's responsibility.

5.4 SAMPLING EQUIPMENT CONSTRUCTION MATERIALS

To prevent direct contamination or cross-contamination of the collected sample, great attention must be given to the construction material used for sampling equipment. Materials must be inert, non-porous and easy to clean. Preferred materials include Teflon®, glass, stainless steel and plastic. Plastics may not be used for collections where organics are the analytes of interest. Stainless steel may not be used where metallic compounds will be analyzed.

5.5 SELECTION OF PARAMETERS BEING ANALYZED

Parameters for analysis are usually dictated by and based on regulated monitoring conditions (i.e. NPDES or RCRA permits). If these do not apply, analyses are selected by ESC or the customer based on federal regulations specific to the matrix being investigated.

5.6 ORDER OF SAMPLE COLLECTION

Unless field conditions demand otherwise, the order of sample collection is as follows:

1. Volatile organic compounds (VOCs)
2. Extractable Organics (includes Total Recoverable Petroleum Hydrocarbons [TRPH], Oil & Grease, Pesticides and Herbicides)
3. Total metals
4. Dissolved metals
5. Microbiological
6. Inorganic (includes Nutrients, Demand, and Physical Properties)
7. Radionuclides

5.7 SPECIAL PRECAUTIONS FOR TRACE CONTAMINANT SAMPLING

Many contaminants can be detected in the parts per billion or parts per trillion range and extreme care must be taken to prevent cross-contamination. Therefore, extra precautions apply where samples are collected for trace contaminants. These precautions include:

- A new pair of disposable latex gloves must be worn at each sampling location.
- Sample containers for samples suspected of containing high concentrations of contaminants are sealed in separate plastic bags immediately after collection and preservation.
- If possible, background samples and source samples should be collected by different field sampling teams. If different field teams are not possible, all background samples are collected first and placed in separate ice chests or shipping containers. Samples of waste or highly contaminated samples are not be placed in the same container as environmental samples. Ice chests or shipping containers for source samples or samples that are suspected to contain high concentrations of contaminants are discarded after use.
- If possible, one member of the field team should handle all data recording, while the other members collect samples.
- When sampling surface waters, water samples should always be collected before sediment samples are collected.
- Sample collection activities should proceed from the suspected area of least contamination to the suspected area of greatest contamination.
- ESC personnel uses equipment constructed of Teflon®, stainless steel, or glass that has been properly pre-cleaned (Sections 12.3 & 12.4) for collecting samples for trace metals or organic compounds analyses. Teflon®, glass, or plastic is preferred for collecting samples where trace metals are of concern. Equipment constructed of plastic or PVC are not be used to collect samples for trace organic compounds analyses.
- When fuel powered units are utilized, they are placed downwind and away from any sampling activities.
- Monitoring wells with free product are not sampled for trace contaminant analysis.

5.8 SAMPLE HANDLING AND MIXING

Sample handling should be kept to a minimum. ESC personnel must use extreme care to avoid sample contamination. If samples are placed in an ice chest, personnel should ensure that sample containers do not become submerged or tip over as this may result in cross-contamination. Small sample containers (e.g., VOCs or bacterial samples) are placed in airtight plastic bags to prevent cross-contamination.

Once a sample has been collected, it may have to be split into separate containers for different analyses. A liquid sample is split by shaking the container or stirring the sample contents with a clean pipette or pre-cleaned Teflon® rod. Then the contents are alternately poured into respective sample containers. Items used for stirring must be cleaned in accordance with the guidelines set forth in Section 12.0. Samples for VOCs, Cyanide, Total Phenol, and Oil & Grease must be collected as discrete grabs.

A soil sample may be split but must first be homogenized as thoroughly as possible to ensure representative sub-samples of the parent material. This is accomplished using the quartering method. The soil is placed in a sample pan and divided into quarters. Each quarter is mixed separately then all quarters are mixed together. This is repeated several times until the sample is uniformly mixed. If a round bowl is used, mixing is achieved by stirring the material in a circular fashion with occasional inversion of the material.

Soil and sediment samples collected for volatile organic compounds are not be mixed. The appropriate sample container should be filled completely, allowing little to no headspace.

Moisture content inversely affects the accuracy of mixing and splitting a soil sample.

5.9 QUALITY CONTROL SAMPLES

Quality control samples must be collected during all sampling events to demonstrate that the sample materials have not been contaminated by sampling equipment, chemical preservatives, or procedures relating to the sample collection, transportation and storage. A summary of the recommended frequency for collecting field quality control samples is presented in the following:

5.9.1 Quality Control Samples

Number of samples	Pre-cleaned equipment blank[1]	Field cleaned equipment blank	Trip blank (VOCs)	Duplicate
10 or more	minimum of 1 then 5%	minimum of 1 then 5%	one per cooler[2]	minimum one then 10%[3]
5 - 9	one	one	one per cooler[2]	one
less than 5	one	one	one per cooler[2]	Not required, but recommend a minimum of one. USACE projects require one. Customer specific QAPP requirements must be considered.

[1] Pre-cleaned blanks are to be collected after the initial decontamination procedure has been completed but before the first sample is collected. Only one pre-cleaned or field-cleaned blank is required if less than 10 samples are collected. Only analyte-free water as defined in this document will be used in the preparation of any field and/or equipment blank.

[2] Where VOC methods are analyzed simultaneously, such as 601/602, only one (1) trip blank is required per cooler.

[3] Duplicate samples are collected for all VOC samples.

5.10 VOLATILE ORGANIC COMPOUND SAMPLING

Water Samples

Generally, groundwater, drinking water and wastewater samples for the analysis of volatile organic compounds are collected in duplicate pre-labeled 40mL vials. During bottle kit preparation in the laboratory, 200µL of concentrated HCl is added to each clean and empty vial. A Teflon® septum is placed in each cap and a cap is placed securely on each vial.

The sampler should check the water being sampled for residual chlorine content. This is done with residual chlorine testing strips. If no chlorine is present, the prepared vials may be filled as needed. If residual chlorine is present, add sodium thiosulfate ($Na_2S_2O_3$) to each vial prior to sampling.

To fill the vial properly, the sample is poured slowly down the inside wall of the vial until a convex meniscus is formed. Care should be taken to minimize turbulence. The cap is then applied to the bottle with the Teflon® side of the septum contacting the sample. Some overflow is lost; however air space in the bottle should be eliminated. Check for air bubbles by inverting the capped vial and tapping against the heel of the hand. This will dislodge bubbles hidden in the cap. If any bubbles are present, repeat the procedureusing a clean vial and re-sample with a new preserved and septum. At a minimum, duplicate vials should always be collected from each sample location.

For analysis using EPA Method 524.2, samples that are suspected to contain residual chlorine, 25mg of ascorbic acid per 40mL of sample is added to each sample vial prior to sampling. Additionally, if analytes that are gases at room temperature (i.e. vinyl chloride, etc.) or any of the analytes in following table are not to be determined, 3mg of sodium thiosulfate is recommended for use to remove residual chlorine during sampling. If residual chlorine is present in the field sample at >5mg/L, then add additional 25mg or ascorbic acid or 3mg of sodium thiosulfate for each 5mg/L of residual chlorine present. Sample vials are filled as previously described. Following collection and dechlorination, Method 524.2 samples are adjusted to a pH of <2 with HCl.

Acetone	Acrylonitrile	Allyl chloride
2-Butanone	Carbon disulfide	Chloroacetonitrile
1-Chlorobutane	t-1,2-Dichloro-2-butene	1,1-Dichloropropanone
Diethyl ether	Ethyl methacrylate	Hexachloroethane
2-Hexanone	Methacrylonitrile	Methylacrylate
Methyl iodide	Methylmethacrylate	4-Methyl-2-pentanone
Methyl-tert-butyl ether	Nitrobenzene	2-Nitropropane
Pentachloroethane	Propionitrile	Tetrahydrofuran

For more detailed instructions, see the published method.

Soil Samples

Option 1 – Core Sampling Device
Soil samples for volatile organic analysis are sampled using traditional core sampling methods. Once the core sample is collected, additional samples should be taken using an Encore™ sampler, either 5g or 25g, capped, sealed, and immediately cooled. The holding time for this method is 48 hours.

Option 2 – Pre-weighed Vial
In the other option for volatile soil sampling, 40mL vials with cap, Teflon® lined septum, preservative (5mL sodium bisulfate solution), and stir bar are pre-weighed, either by the user or the manufacturer. The vial is weighed on a balance capable of measuring to 0.01g and labeled with the pre-weighed value. In the field, place roughly 5g of sample into a pre-weighed vial, cap, and then immediately place on ice to achieve a temperature of ≤6ºC. Exact soil weights can be measured using the pre-weight of the vial and the post-sampling weight. The difference represents the actual weight of the soil sample. The holding time for this method is 14 days.

Unless specifically permitted by the regulatory authority, VOC samples (liquid or solid) should never be mixed or composited.

5.11 OIL AND GREASE SAMPLING

Aqueous samples collected for oil and grease analyses must be collected as discrete grab samples. Sample containers should not be rinsed with sample water prior to sample collection and samples should be collected directly into the sample container. Intermediate vessels should only be used where it is impossible to collect the sample directly into the sample container and, in this case, only Teflon® beakers should be used. Samples should be taken from well-mixed areas.

5.12 CYANIDE SAMPLING

Cyanide is a very reactive and unstable compound and should be analyzed as soon as possible after collection. Samples are collected in polyethylene or glass containers and are pretreated and preserved in the manner specified in the following paragraphs.

5.12.1 Test for Oxidizing Agents

1. Test the sample with residual chlorine indicator strips.
2. Add a few crystals of ascorbic acid and test until negative.
3. Add an additional 0.6 grams of ascorbic acid for each liter sampled to remove residual chlorine.
4. Preserve the pretreated sample by to a pH > 12.0 with NaOH and cool to 4 $\pm$ 2°C. Verify the pH of the samples as per Section 14.2.
5. Equipment blanks must be handled in the same manner as described in steps 1 through 4.

5.12.2 Test for Sulfide

1. Test the sample for sulfide using the sulfide test strip (formally HACH KIT).
2. If sulfide is not removed by the procedure below, the sample must be preserved with NaOH to pH > 12.0 and analyzed by the laboratory within 24 hours.
3. Sulfide should be removed by filtering visible particulate. Retain filter (filter #1).
4. Remove the sulfide by adding lead carbonate powder to the filtrate to cause the sulfide to precipitate out.
5. Test the filtrate for the presence of sulfide. If sulfides are present, repeat steps 1 and 4 until no sulfides are shown present.
6. The precipitate can now be filtered from the sample and this filter is discarded.
7. The sample is then reconstituted by adding the sediment collected on filter #1 back to the filtrate.
8. Preserve the pretreated sample to a pH > 12.0 with NaOH and cool to 4 $\pm$ 2°C. Verify the pH of the samples as per Section 14.2
9. Equipment blanks must be handled in the same manner as described in steps 1 through 9.

5.13 BIOMONITORING SAMPLING

Aqueous samples collected for Bioassay can be collected in either glass or HDPE plastic. There is no chemical preservation for this type of sample and the required volume varies with each type of analysis. Following sampling, all samples must be cooled to 0-6°C and can be held for a maximum of 36 hours from the time of collection. Grab and composite sample protocols are utilized for acute and chronic bioassays and are chosen according to permit requirements. Samples are collected with minimum aeration during collection and the container are filled allowing no headspace. Samples may be shipped in one or more 4L (l gal.) CUBITAINERS® or unused plastic "milk" jugs. All sample containers should be rinsed with source water before being filled with sample. Containers are not reused. If the sample is a chlorinated effluent, total residual chlorine must be measured immediately following sample collection.

5.14 PROCEDURES FOR IDENTIFYING POTENTIALLY HAZARDOUS SAMPLES

Any sample either known, or suspected, to be hazardous are identified as such on the chain of custody. Information explaining the potential hazard (i.e., corrosive, flammable, poison, etc.) are also be listed.

5.15 COLLECTION OF AUXILIARY DATA

All auxiliary data are entered in the field records. Auxiliary data relative to a particular sampling location should be recorded concurrent with the sample event. Matrix specific auxiliary data are discussed later in this section.

5.16 TIME RECORDS

All records of time are kept using local time in the military (24 hour) format and are recorded to the nearest minute.

5.17 REFERENCES

ESC maintains copies of the various sampling references in the sample equipment room. Pertinent pages of these documents may be photocopied and taken to the field during sampling investigations. A bibliography of references used in the development of this section is presented in Section 17.

6.0 ANCILLARY EQUIPMENT AND SUPPLIES

The equipment used to collect samples and conduct necessary purging activities is listed in subsequent sections for each type of sample. However, Section 6.1 lists some of the ancillary field equipment and instruments that may be required.

6.1 ANCILLARY EQUIPMENT AND SUPPLIES

Flow Measurement:	ISCO Continuous Flow Meters 3230, 3210, 2870; Flo-Poke pipe insert
Personal Protective Equipment:	Hard Hats, Face Shields, Rubber and Latex Gloves, Tyvex protective coveralls, rubber boots, safety glasses
Field Instruments:	Water Level Indicator, Continuous Recording pH Meter, Portable pH/Temperature Meters, Hach DR-100 Chlorine Analyzer, Hach CEL/700 Portable Laboratory, YSI Field Dissolved Oxygen/Temperature Meter w/ Submersible Probe, Portable Field Specific Conductance Meter, Hach 2100P Portable Turbidimeter
Chemical Supplies & Reagents:	Deionized Water, Tap Water, Liquinox Detergent, Isopropanol, Nitric Acid, Hydrochloric Acid, Sulfuric Acid, Sodium Hydroxide, Ascorbic acid, Sodium Thiosulfate, Ascorbic Acid, Zinc Acetate, pH calibration buffers (4.0, 7.0, and 10.0), Hach Sulfide Kit, lead carbonate powder, Specific Conductance Standard, Turbidity Standards
Tools:	Pipe Wrench, Bung Wrench, Crowbar, Hammer, Assorted Screwdrivers, Tape Measures, Channel Lock Pliers, Vise Grip Pliers, Duct Tape, Vinyl Pull Ties
Miscellaneous:	Cellular Phones, Pagers, Walkie Talkies, 12 Volt Batteries, Flashlights, Extension Cords, Brushes, Plastic sheeting, Fire extinguishers, Water Squeeze Bottles, First Aid Kit, lengths of rigid PVC conduit, aquatic sampling nets (Wildco)

7.0 WASTEWATER SAMPLING

7.1 SAMPLING EQUIPMENT

Type	Use	Materials	Permissible Parameter Groups
Continuous Wastewater Samplers-Peristaltic Pump	Sampling	Tygon tubing; glass or plastic sample container	All parameter groups except oil & grease, extractable organics, and VOCs
	Sampling	Teflon® tubing; glass sample container	All parameter groups except VOCs

7.2 GENERAL CONSIDERATIONS

The procedures used by ESC are generally those outlined in the *NPDES Compliance Inspection Manual*. Additional guidance is given in the EPA *Handbook for Monitoring Industrial Wastewater*. Some important considerations for obtaining a representative wastewater sample include:

- The sample should be collected where the wastewater is well mixed.
- Samples should not be collected directly from the surface/bottom of the wastestream.
- In sampling from wide conduits, cross-sectional sampling should be considered.
- If manual compositing is employed, the individual sample bottles must be thoroughly mixed before pouring the individual aliquot into the composite container.

7.3 SAMPLING SITE SELECTION

Wastewater samples should be collected at the location specified in the NPDES or sewer use permit if such exists. If the specified sampling location proves unacceptable, the project manager shall select an appropriate location based on site-specific conditions. An attempt should be made to contact the regulatory authorities for their approval. The potential for this type of issue highlights the need for a site inspection prior to the scheduled sampling event.

7.3.1 Influent

Influent wastewaters should be sampled at points of high turbulence and mixing. These points are: (1) the upflow siphon following a comminutor (in absence of grit chamber); (2) the upflow distribution box following pumping from main plant wet well; (3) aerated grit chamber; (4) flume throat; or (5) pump wet well when the pump is operating. Raw wastewater samples should be collected upstream of sidestream returns.

7.3.2 Effluent

Effluent samples should be collected at the site specified in the permit or, if no site is specified, at the most representative site downstream from all entering wastewater streams prior to final discharge.

7.3.3 Pond and Lagoon Sampling

Composite samples of pond and lagoon effluent are preferred over grabs due to the potential for ponds and lagoons to short circuit the projected flow paths. However, if dye studies or facility data indicate a homogeneous discharge, grab samples may be taken.

7.4 SAMPLING TECHNIQUES: GENERAL

The choice of a flow-proportional or time-proportional composite sampling program depends upon the variability of flow, equipment availability, sampling point configuration and accessibility. Flow metered sampling is necessary for complete wastewater characterization and should be utilized where possible. If not feasible, a time-proportional composite sample is acceptable.

A time-proportional composite sample consists of aliquots collected at constant time intervals and can be collected either manually or with an automatic sampler.

A flow proportional composite sample consists of aliquots collected automatically at constant flow intervals with an automatic sampler and a flow-measuring device. Prior to flow-proportional sampling, the flow measuring system (primary flow device, totalizer, and recorder) should be examined. The sampler may have to install flow measurement instrumentation if automatic sampling is to be used.

7.5 USE OF AUTOMATIC SAMPLERS

7.5.1 General

Automatic samplers are used when several points are sampled at frequent intervals, with limited personnel, or when a continuous sample is required. Automatic samplers used by ESC must meet the following requirements:

- Must be properly cleaned to avoid cross-contamination from prior sampling events.
- No plastic or metal parts shall come into contact with the sample when parameters to be analyzed could be impacted by these materials.
- Must be able to provide adequate refrigeration. Commercially available ice is placed in the sampler base and packed around the container approximately half way up the sample container.
- Must be able to collect a large enough sample for all required analyses. Composite sample containers (glass or plastic) hold up to 10 liters.
- A minimum of 100 milliliters should be collected each time the sampler is activated.
- Should provide a lift of at least 20 feet and be adjustable so that sample volume is not a function of pumping head.
- Pumping velocity must be adequate to transport solids without settling.
- The intake line must be purged a minimum of one time before each sample is collected.
- The minimum inside diameter of the intake line should be 1/4 inch.
- Have a power source adequate to operate the sampler for 48 hours at 15-minute sampling intervals.
- Facility electrical outlets may be used if available.

- Facility automatic samplers may be used for conventional parameters if they meet ESC QA/QC criteria.

Specific operating instructions, capabilities, capacities, and other pertinent information for automatic samplers presently used by ESC are included in the respective operating manuals and are not presented here.

All data relative to the actual use of automatic equipment on a specific job is recorded in sampling logbooks.

7.5.2 Equipment Installation

7.5.2.1 Conventional Sampling

Automatic samplers may be used to collect time-proportional composite or flow-proportional composite samples. In the flow-proportional mode, the samplers are activated by a compatible flow meter. Flow-proportional samples can also be collected using a discrete sampler and a flow recorder and manually compositing the individual aliquots in flow-proportional amounts.

Installation procedures include cutting and installing the proper length of tubing, positioning it in the wastewater stream, and sampler programming. All new tubing (Dow® Corning Medical Grade Silastic, or equal, in the pump and Tygon®, or equal, in the sample train) will be used for each sampler installation.

For a time-proportional composite, the sampler should be programmed to collect 100mL samples at 15-minute intervals into a refrigerated 10L plastic or glass jug, as appropriate for the particular parameters being analyzed.

For a flow-proportional composite, the sampler should be programmed to collect a minimum of 100mL for each sample interval. The sampling interval should be based on the flow of the waste stream.

7.5.3 Automatic Sampler Maintenance, Calibration, and Quality Control

To ensure proper operation of automatic samplers, the procedures outlined in this section are used to maintain and calibrate ESC automatic samplers. Any variance from these procedures is documented.

Proper sampler operation is checked by ESC personnel prior to each sampling event. This includes checking operation through three cycles of purge-pump-purge; checking desiccant and replacing if necessary; checking charge date on NiCad batteries to be used; and repairing or replacing any damaged items.

Prior to beginning sampling, the purge-pump-purge cycle is checked at least once. The sample volume is calibrated using a graduated cylinder at least twice, and the flow pacer that activates the sampler is checked to be sure it operates properly.

Upon return from a field trip, the sampler is examined for damage. The operation is checked and any required repairs are performed and documented. The sampler is then cleaned as outlined in Section 12.

7.6 MANUAL SAMPLING

Manual sampling is normally used for collecting grab samples and for immediate in-situ field analyses. Manual sampling may also be used when it is necessary to evaluate unusual waste stream conditions. If possible, manually collected samples are collected in the actual sample container that is submitted to the laboratory. This minimizes the possibility of contamination from an intermediate collection container.

Manual samples are collected by (1) submerging the container neck first into the water; (2) inverting the bottle so that the neck is upright and pointing into the direction of wastewater flow; (3) quickly returning the sample container to the surface; (4) shake to rinse. Pour the contents out downstream of sample location; (5) collect sample as described in steps 1, 2, and 3; pour out a few mL of sample downstream of sample collection. This allows for addition of preservatives and sample expansion.

Exceptions to the above procedure occur when preservatives are present in the sampling container or when oil & grease, microbiological, and/or VOC analyses are required. In these cases, samples are collected directly into the container with no pre-rinsing.

If the water or wastewater stream cannot be physically or safely reached, an intermediate collection container may be used. This container must be properly cleaned (Section 12) and made of an acceptable material. A separate collection container should be used at each sampling station to prevent cross-contamination between stations. The sample is collected by lowering a properly cleaned Teflon®, plastic, or glass collection vessel into the waste stream. The intermediate vessel may be lowered by hand, pole or rope.

7.7 SPECIAL SAMPLE COLLECTION PROCEDURES

7.7.1 Trace Organic Compounds and Metals

Due to the ability to detect trace organic compounds and metals in extremely low concentrations, care must be taken to avoid contamination of the sample. All containers, composite bottles, tubing, etc., used in sample collection for trace organic compounds and metals analyses should be prepared as described in Section 12.

Personnel handling the sample should wear a new pair of disposable latex gloves with each set of samples collected to prevent cross-contamination. A more detailed discussion is given in Section 5.7 under special precautions for trace contaminant sampling.

7.7.2 Bacterial Analysis

Samples for bacterial analysis are always collected directly into the prepared glass or plastic sample bottle. The sample bottle should be kept closed until immediately prior to sampling and never rinsed with sample. When the container is opened, care should be taken not to contaminate the cap or the inside of the bottle. The bottle should be held near the base and plunged, neck downward, below the surface and turned until the neck points upward and upstream. The bottle should be filled to within one-inch of the top and capped immediately.

Section 14 presents preservation procedures and holding times. As holding times are limited to 6 hours for microbiological analyses, special arrangements may be required to ensure that these samples reach the laboratory within this timeframe.

7.7.3 Immiscible Liquids/Oil and Grease

Oil and grease may be present in wastewater as a surface film, emulsion, solution, or a combination of these forms. A representative sample for oil and grease analysis is difficult to collect. The sampler must carefully evaluate the location of the sampling point to find the area of greatest mixing. Quiescent areas should be avoided.

Because losses of oil and grease will occur on sampling equipment, collection by composite sampler is not practical. Intermediate sampling vessels should not be used if possible. If intermediate collection vessels are required they should be made of Teflon® and be rinsed with the sample three times before transferring any sample to the sample container. Sample containers, however, should never be rinsed.

7.7.4 Volatile Organic Compounds Analyses

Water samples to be analyzed for volatile organic compounds are collected in 40mL pre-preserved (200uL of concentrated HCl) vials with screw caps. A Teflon®-silicone septum is placed in each cap prior to the sampling event. The Teflon® side must be facing the sample.

Sampling containers with preservatives are pre-labeled prior to any field activities to reduce the chances of confusion during sampling activities. A complete list of sample preservatives, containers, holding times, and volumes is found in Section 14.

The sampler should check the water to be sampled for chlorine. This is done with residual chlorine indicator strips. If no chlorine is found, the vials may be filled. If residual chlorine is present, the sampling and preservation procedures listed in Section 5.10 of this manual must be performed.

7.8 AUXILIARY DATA COLLECTION

While conducting wastewater sampling, the following information may also be gathered:

- Field measurements -- pH, DO, conductivity, temperature
- Flows associated with the samples collected -- continuous flows with composite samples and instantaneous flows with grab samples
- Diagrams and/or written descriptions of the sample locations
- Photographs of pertinent wastewater-associated equipment, such as flow measuring devices, treatment units, etc.
- Completion of applicable forms required during specific investigations.

All observations, measurements, diagrams, etc., are entered in field logbooks or attached thereto.

8.0 SURFACE WATER AND SEDIMENT SAMPLING

8.1 EQUIPMENT

Equipment Type	Use	Material	Permissible Parameter Groups
Surface Water Sampling			
Kemmerer Sampler	Depth sampling	PVC	All parameter groups except extractable organics, VOCs, and oil & grease
Automatic Samplers	Sampling	Teflon®	All parameter groups except VOCs, oil & grease, & micro
	Sampling	PVC	All parameter groups except extractable organics, VOCs, oil & grease, and micro
Sample Collection Container	Sampling	Stainless steel	All parameter groups
Bailers	Sampling	Teflon®	All parameter groups
	Sampling	PVC	All parameter groups except extractable organics, VOCs, and oil & grease
Sediment Sampling			
Hand Augers	Sampling	Carbon Steel	Demand, nutrients, and extractable organics (for hard packed soils only)
Sediment Core Sampler	Sampling	Stainless Steel, Teflon®	All parameter groups
Encore™	Sampling	Teflon®	VOC Sediment/soil
Scoops	Sampling	Teflon® coated	All parameter groups

Equipment Type	Use	Material	Permissible Parameter Groups
Mixing Bowl	Compositing	Glass	All parameter groups except VOCs
Spoons, spatula	Sampling, compositing	Stainless Steel	All parameter groups

8.2 GENERAL

Selection of surface water sampling locations for water quality studies are determined by the objective of the study and waterway type. Factors that impact and alter water quality and characteristics (dams, bridges, discharges, etc.) must be considered. Accessibility is important.

8.3 SAMPLE SITE SELECTION

Fresh water environments are commonly divided into two types: (1) rivers, streams, and creeks; and (2) lakes, ponds, and impoundments. Since these waterways differ considerably in general characteristics, site selection must be adapted to each.

Prior to conducting a sampling event, an initial survey should be conducted to locate prime sampling points. Bridges and piers provide ready access to sampling points across a body of water. However, they should only be used when found not to be detrimentally impacting stream characteristics.

If wading for water samples must be done, caution should be used to avoid disturbing bottom deposits that could result in increased sediment in the sample. Shallow areas may be best for sediment sampling.

8.3.1 Rivers, Streams, and Creeks

Sampling sites should be located in areas possessing the greatest degree of cross-sectional homogeneity. Such points are easily found directly downstream of a riffle or rapid. These locations are also good for sediment sampling. In the absence of turbulent areas, a site that is clear of immediate point sources, such as tributaries and effluent discharges, may be used.

Typical sediment deposition areas are located at the inside of river bends and down-stream of islands or other obstructions. Sites immediately upstream or downstream from the confluence of two streams or rivers should be avoided due to inadequate mixing of the combining flows. Also, backflow can upset normal flow patterns.

Great attention should be given to site selection along a stream reach:

- Sites should be spaced at intervals based on time-of-water-travel. Sampling sites may be located at about one-half day time-of-water-travel for the first three days downstream of a waste source for the first six sites and then approximately one day for the remaining distance.

- If the study data is for comparison to previous study data, the same sampling sites should be used.
- Sites should be located at marked physical changes in the stream channel.
- Site locations should isolate major discharges as well as major tributaries.

Dams and weirs usually create quiet, deep pools in river reaches that would otherwise be swift and shallow. When times of travel through them are long, sites should be established within them.

Some structures, such as dams, permit overflow that may cause significant aeration of oxygen deficient water. Sites should be located short distances upstream and downstream of these structures to measure the rapid, artificial increase in dissolved oxygen (DO), which is not representative of natural aeration.

A minimum of three sites should be located between any two points of major change in a stream, even if the time-of-travel between the points of change is short. Major changes include, but are not limited to, a waste discharge, a tributary inflow, or a significant change in channel characteristics. Sampling three sites is also important when testing rates of change of unstable constituents. Results from two of three sites will usually support each other and indicate the true pattern of water quality in the sampled zone. If the effect of certain discharges or tributary streams of interest is desired, sites should be located both upstream and downstream of these points.

Due to the tendency of the influent from a waste discharge or tributary to slowly mix, cross-channel, with the main stream, it is nearly impossible to measure their effect immediately downstream of the source. Thus, samples from quarter points may miss the wastes and only indicate the quality of water above the waste source. Conversely, samples taken directly in the stream portion containing the wastes would indicate excessive effects of the wastes with respect to the river as a whole.

Tributaries should be sampled as near the mouth as possible. Often, these may be entered from the main stream for sampling by boat. Care should be taken to avoid collecting water from the main stream that may flow back into the tributary as a result of density differences created by temperature, salinity, or turbidity differences.

Actual sampling locations vary with the size and amount of turbulence in the stream or river. Generally, with streams less than 20 feet wide, well mixed areas and sampling sites are readily found. In such areas, a single grab sample taken at mid-depth at the center of the channel is adequate. A sediment sample can also be collected at the center of the channel. For slightly larger streams, at least one vertical composite should be taken from mid-stream. It should be composed of at least one sub-surface, mid-depth, and above the bottom sample. Dissolved oxygen, pH, temperature, conductivity, etc. should be measured on each aliquot of the vertical composite. Several locations should be sampled across the channel width on the larger rivers. Vertical composites across the channel width should be located

proportional to flow, i.e., closer together toward mid-channel where flow is greater and less toward the banks where the flow proportionally lower.

The field crew will determine the number of vertical composites and sampling depths for each area. They should base their decisions upon two considerations.

1. The larger the number of sub-samples, the more nearly the composite sample will represent the water body.
2. Taking sub-samples is time consuming and expensive, and increases the chance of contamination.

A number of sediment samples should be collected along a cross-section of a river or stream to adequately characterize the bed material. The normal procedure is to sample at quarter points along the cross-section of the site. When the sampling technique or equipment requires that the samples be extruded or transferred at the site, they can be combined into a single composite sample. However, samples of dissimilar composition should not be combined. They should be kept separate for analysis in the laboratory. To ensure representative samples, coring tubes are employed. The quantity of each sub-sample that is composited shall be recorded.

8.3.2 Lakes, Ponds, and Impoundments

Lakes, ponds, and impoundments have a much greater tendency to stratify than rivers and streams. This lack of mixing requires that more samples be obtained from the different strata. Occasionally, extreme turbidity differences occur vertically where a highly turbid river enters a lake. This stratification is caused by temperature differences where the cooler, heavier river water flows beneath the warmer lake water. A temperature profile of the water column and visual observation of lake samples can detect these layers. Each layer of the stratified water column should be sampled.

The number of sampling sites on a lake, pond, or impoundment is determined by the objectives of the investigation dimensions of the basin. In small bodies of water, a single vertical composite at the deepest point may be sufficient. Dissolved oxygen, pH, temperature, etc., should be conducted on each vertical composite aliquot. In naturally formed ponds, the deepest point is usually near the center; in impoundments, the deepest point is usually near the dam.

In lakes and larger impoundments, several vertical sub-samples should be composited to form a single sample. These vertical sampling locations should be along a transaction or grid. The field crew will determine the number of vertical composites and sampling depths for each area. In some cases, separate composites of epilimnetic and hypolimnetic zones may be required. Additional separate composite samples may be needed to adequately represent water quality in a lake possessing an irregular shape or numerous bays and coves. Additional samples should always be taken where discharges, tributaries, agriculture, and other such factors are suspected of influencing water quality.

When collecting sediment samples in lakes, pond, and reservoirs, the sample site should be as near as possible to the center of the water mass, especially for impoundments of rivers or streams. Generally, coarser grained sediments are deposited at the headwaters of a reservoir, and the finer sediments are near the center. The shape, inflow pattern, bathymetry, and circulation affect the location of sediment sampling sites in large bodies of water.

8.3.3 Control Sites

The collection of samples from control sites is necessary to compile a basis of comparison of water quality. A control site above the point of interest is as important as the sites below, and must be chosen with equal care. Two or three sites above the waste inflow may be necessary to establish the rate at which any unstable material is changing. The time of travel between the sites should be sufficient to permit accurate measurement of the change in the material under consideration.

8.4 SAMPLING EQUIPMENT AND TECHNIQUES

8.4.1 General

Any equipment or sampling techniques used to collect a sample must not alter the integrity of the sample and must be capable of providing a representative sample.

8.4.2 Water Sampling Equipment/Techniques

The physical location of the collector dictates the type of equipment needed to collect samples. Surface water samples may be collected directly into the sample container when possible. Pre-preserved sample containers shall never be used as intermediate collection containers. Samples collected in this manner use the methods specified in Section 7.6 of this manual. If wading into the stream is required, care should be taken not to disturb bottom deposits, which could be unintentionally collected, and bias the sample. Also, the sample should be collected directly into the sample bottle and **up current** of the wader. If wading is not possible or the sample must be collected from more than one depth, additional sampling equipment may be used. If sampling from a powerboat, samples must be collected upwind and upstream of the motor.

8.4.2.1 Sampling Procedure Using a Teflon® or PVC Bailer

If data requirements of surface water sampling do not necessitate sampling from a strictly discrete interval of the water column, Teflon® or PVC constructed bailers can be used for sampling. The type bailer used is dependent on the analytical requirements. A closed top bailer utilizing a bottom check valve is sufficient for many surface water studies. Water is continually displaced through the bailer as it is lowered down through the water column until the specified depth is attained. At this point, the bailer is retrieved back to the surface. There is the possibility of

contamination to the bailer as it is lowered through the upper water layers. Also, this method may not be successful in situations where strong currents are found or where a discrete sample at a specified depth is needed.

If depth specific, discrete samples are needed and the parameters do not require Teflon® coated sampling equipment, a standard Kemmerer sampler may be used. A plastic bucket can also be used to collect surface samples if parameters to be analyzed do not preclude its use. The bucket shall always be rinsed twice with the sample water prior to collection and the rinse water be disposed of downstream from the sample collection point. All field equipment will be cleaned using standard cleaning procedures.

8.4.2.2 Sampling Procedure Using a Kemmerer Sampler

Due to the PVC construction of the Kemmerer sampler, it shall not be used to collect samples for extractable organics, VOCs, and/or oil & grease analysis. The general collection procedure is as follows:

1. Securely attach a suitable line to the Kemmerer bottle.
2. Lock stoppers located at each end of the bottle on the open position. This allows the water to be drawn around the bottom end seal and into the cylinder at the specified depth.
3. The bottle is now in the set position. A separate "messenger" is required to activate the trip mechanism that releases the stopper and closes the bottle.
4. When the bottle is lowered to the desired depth, the messenger is dropped. This unlocks the trip mechanism and forces the closing of both end seals.
5. Raise the sampler, open one of the end seal, and carefully transfer the sample to the appropriate sample container.

8.4.2.3 Sampling Procedures Using Sample Collection Containers

In most cases, sample collection containers are used to collect surface water from easily accessible sampling points. This means that the sample is collected manually, always upstream of the sampling person's position. An extension may be added to the container to make the sampling point more accessible for manual sampling. Extensions can be constructed of aluminum, PVC, steel, or any other suitable material. The sample container is normally attached to the extension using a clamp, vinyl pull ties, or duct tape. Samples collected in this way are done so in the following manner:

1. Place the inverted sample container into the water and lower to the desired depth. Never use a pre-preserved container as an intermediate sample collection device.
2. Re-invert the container with the mouth facing into the direction of flow and at the appropriate depth to collect the desired sample.
3. Carefully bring the container to the surface and transfer to the appropriate container.

8.4.3 Sediment Sampling Equipment/Techniques

A variety of methods can be used to collect sediment samples from a streambed. ESC utilizes corers and scoops. Precautions must be taken to ensure that the sample collected is representative of the streambed. These methods are discussed in the following paragraphs.

8.4.3.1 Sediment Core Samplers

Core sampling is used to collect vertical columns of sediment from the stream or lakebed. Many types of coring devices are available for use depending on the depth of water from which the sample is obtained, the type of bottom material, and the length of the core to be collected. Some devices are weight or gravity driven while others are simple hand push tubes. These devices minimize the loss of fine particles and should always be used when collecting sediment samples from flowing waters.

Coring devices are particularly useful in pollutant monitoring because the shock wave created by sampler descent is minimized and the fines at the sediment-water interface are only slightly disturbed. The sample can be withdrawn primarily intact removing only the layers of interest. Core liners manufactured of Teflon® or plastic can be purchased. These liners reduce the possibility of contamination and can be delivered to the laboratory in the tube they were collected in. Coring devices sample small surface areas and small sample sizes and often require repetitive sampling to obtain a sufficient amount of sample. This is the primary disadvantage to these devices but they are recommended in the sampling of sediments for trace organic compounds or metals analyses.

When sampling sediments in shallow water, the direct use of a core liner is recommended. Stainless steel push tubes are also used because they provide a better cutting edge and higher tensile strength than Teflon® or plastic. One advantage to using the Teflon® or plastic tubes is the elimination of possible metals contamination of the sample from the core barrels or cutting heads. The length of the corer tube should correspond to the desired depth of the layer being sampled. In general, soft sediments adhere better to the inside of the tube and a larger diameter tube can be used. Coarser sediments require the use of a smaller diameter tube of two inches or less to prevent the sample from falling out of the tube. The inside bottom wall of the tube can be filed down to allow easier entry into the substrate.

When samples are obtained by wading, caution should be used to minimize disturbance in the area sampled. Core tubes are pushed directly down into softer substrates until four inches or less of the tube is above the sediment-water interface. A slight rotation of the tube may be necessary to facilitate ease of entry into harder substrates and reduce compaction of the sample. The tube is then capped and slowly extracted and the bottom of the corer is capped before it is pulled above the water surface.

Sub-sampling is performed for VOC samples using an Encore™ type sampling device. This device is used to collect soil/sediment samples, while preventing container headspace. Once the core sample is collected, additional samples should be taken using an Encore™ type sampler, either 5g or 25g, capped, sealed, and immediately chilled to 4ºC. The holding time for this sampling method is 48 hours. Alternatively, weigh 5g of sample into a pre-weighed vial (with a Teflon® lined screw cap) containing, 5mL sodium bisulfate solution and a magnetic stir bar, cap, and then ice to 4ºC. The holding time for this method is 14 days.

8.4.3.2 Scooping Samples

The easiest and quickest way to collect a sediment sample in shallow water is with a Teflon® coated scoop or stainless steel spoon. This type of sampling should be limited to quiescent (i.e., non-flowing) waters such as lakes or reservoirs.

8.4.3.3 Mixing

As specified in Section 5.8, sediment samples, collected for chemical analysis, should be thoroughly mixed (except for volatile organic compounds analysis) before being placed in the sample containers.

8.5 SPECIAL SAMPLE COLLECTION TECHNIQUES

8.5.1 Trace Organic Compounds and Metals

Samples for trace pollutant analyses in surface water should be collected by dipping the sample containers directly into the water. Sometimes samples are split for enforcement or quality control purposes. A sufficient volume of sample for all containers should be collected in a large glass container and then, while mixing, be alternately dispensed into the appropriate bottles. This cannot be done for volatile organic compound samples due to potential loss of target analytes.

Only Teflon® or stainless steel should be used in sediment sampling for trace contaminant analyses. Teflon® coring tubes are the preferred technique.

8.5.2 Bacterial Analysis

Samples for bacteriological examination must be collected in sterilized bottles and protected against contamination. The preferred technique is to collect sample directly into the sample bottle. Hold the bottle near the base and plunge, neck downward, below the surface. The container is then turned with the neck pointed slightly upward and the mouth directed toward the current. The bottle is filled to about ½ inch from the top and recapped immediately. While the bottle is open, extreme care should be used to protect both the bottle and stopper against contamination. The ½ inch air space is left in the bottle to facilitate subsequent shaking in the laboratory.

If sampling with an intermediate sampling device (i.e. bailer), the device shall be thoroughly rinsed with sample water prior to collecting the sample. For this reason, microbiological samples are among the final samples collected from a sampling site. Begin pouring sample out of the sampling device before collecting into the sterilized container. Continue pouring sample out of the device, place the container under the flowing stream, and fill the container to ½ inch from the top. Flow should remain continuous before and during the filling process.

When sampling from a bridge, the sterilized sample bottle can be weighted and lowered to the water on a rope. Collectors must be careful not to dislodge debris from the bridge that could fall into the bottle.

8.6 AUXILIARY DATA COLLECTION

A field logbook is used to record data pertinent to sampling activities. This data describes all sampling locations and techniques, lists photographs taken, visual observations, etc. Visual observations of sample site conditions, including weather and overall stream conditions, recorded during the investigation can be valuable in interpreting water quality study results.

8.7 SPLIT AND DUPLICATE SAMPLE COLLECTION

Split samples measure variability between analysts, methods, and laboratories and are taken as subsamples from a single sample. This is unlike duplicate samples that measure variability inherent in the collection method or waste stream and are obtained in close succession during the same sampling event.

8.7.1 Split Sample Collection

Split samples are collected as follows:

1. Sample must be collected in a properly cleaned container constructed of acceptable materials. The volume should be more than twice the volume required for one sample.
2. Add appropriate preservative where required.
3. Mix thoroughly.
4. Alternately, decant sample into subsample containers in increments of approximately 10% of total subsample volume until containers are full.
5. Seal the sample containers with appropriate, airtight caps.
6. Label each sample container with a field number and complete a chain of custody.

NOTE: Volatile organic samples are not collected in this manner. Samples for VOC's must be collected as simultaneous, discrete grab samples.

8.7.2 Duplicate Sample Collection

1. Collect two samples in rapid succession.
2. Preserve where required.
3. Mix thoroughly.
4. Seal the sample containers with appropriate, airtight caps.
5. Label each sample container with a field number and complete a chain of custody.

9.0 GROUNDWATER AND DRINKING WATER SAMPLING

9.1 GROUNDWATER AND DRINKING WATER SAMPLING EQUIPMENT

Equipment type	Purpose	Component(s)	Allowable Parameter Groups
Bailers (disposable and non-disposable)	Purging	Teflon® & SS	All parameter groups
	Sampling	Teflon®	All parameter groups
Peristaltic Pump[1]	Purging[2]	Tygon Tubing	All parameter groups except organics
	Purging	Teflon®	All parameter groups
		Silastic Rubber	All parameter groups except organics
ISCO Bladder Pump[3]	Sampling	Stainless Steel, Teflon®	All parameter groups

[1] New or dedicated tubing must be used at individual monitoring well sites.
[2] If sample is not collected immediately after evacuation, tubing shall be withdrawn from the well prior to pump being turned off to prevent back flowing into the well.
[3] Pump will be cleaned after each use.

9.2 GENERAL GROUNDWATER SAMPLING

Groundwater sampling is necessary for a number of purposes. These include, but are not limited to, evaluating potable or industrial water sources, mapping contaminant plume movement at a land disposal or spill site, RCRA compliance monitoring (landfills), or examining a site where groundwater contamination may have or may be occurring.

Normally, groundwater is sampled from a permanent monitoring well. However, this does not exclude collection of samples from a sinkhole, pit, or other drilling or digging site where groundwater is present.

Monitoring wells are not always at the optimum. In these situations, additional wells may need to be drilled. Experienced, knowledgeable individuals (hydrologists, geologists) are needed to site the well and oversee its installation so that representative samples of groundwater can be collected.

ESC utilizes the procedures being reviewed in this section. Further guidance is available in the *RCRA Groundwater Monitoring Technical Enforcement Guidance Document (TEGD)*; ESC field personnel, at a minimum meet, and when possible exceed, the requirements of this document.

9.3 Measurement of Well Water Level and Stagnant Water Volume Calculation

The sampling and analysis plan provides for measurement of standing water levels in each well prior to each sampling event. Field measurements include depth to standing water surface and total depth of the well. This data is then utilized to calculate the volume of stagnant water in the well and provide a check on the integrity of the well (e.g., silt buildup). The measurement should be taken to 0.01 foot when possible. A battery powered level sensor is used to measure depth to the surface of the groundwater. Equipment shall be constructed of inert materials and will be cleaned per sample equipment cleaning procedures prior to use at another well. Field data is recorded on the Monitoring Well Data Sheet (Figure 2).

9.3.1 Procedure for Water Level Measurement

1. Clear debris from area around well or lay plastic sheathing around well pad.
2. Remove protective casing lid.
3. Open monitoring well lid.
4. Lower the clean water level indicator probe down into the well. A beep will sound upon contact with the water surface. False readings can be made from the wetted side of the well so it is necessary to check the level several times until a consistent reading is achieved. Record the distance (to the nearest 0.01 ft.) from the top of the well casing to the water surface on the Monitoring Well Data Sheet.
5. Continue to lower the probe until it reaches the well bottom. Record the distance (to the nearest 0.01 ft) from the top of the well casing to the bottom of the well on the Monitoring Well Data Sheet.
6. All water level and well depth measurements are made from the top of the well casing unless specified otherwise by the project manager or DER.
7. The wetted depth is obtained by subtracting total well depth from the surface level depth.

9.3.2 Calculating Water Volume

Total volume of standing water in a well is calculated by the following formula:

$$V = \pi r^2 h \times 7.48 \text{ gallons/ft}^3$$

where;

V	=	volume of standing water in the well (gallons)
r	=	radius of well (ft)
h	=	depth of water column in the well (ft)
π	=	3.14
7.48	=	conversion factor

9.4 WELL EVACUATION: WELLS WITHOUT IN-PLACE PLUMBING

Water standing in a well may not be representative of actual groundwater conditions. The standing water in a well should be removed to allow representative formation water to supplant the stagnant water. The evacuation method depends on the hydraulic characteristics of the well but the following general rules apply.

The total amount of water purged must be recorded. Therefore, the volume must be measured during the purging operation. This may be determined by:

1. Collecting the water in a graduated or known volume container (i.e., bucket);
2. Calculate the volume based on the pump rate; however pump rate may not be constant and field personnel should be aware of this;
3. Record the time that the actual purging begins in the field record.

Purging is considered complete if any one of the following criteria is satisfied:

1. Three well volumes are purged and field parameters (pH, temperature, conductivity) stabilize within 5% in consecutive readings at least 5 minutes apart. If field parameters have not stabilized after 5 well volumes, the purging is considered complete and sampling can begin.
2. Five well volumes are purged with no monitoring of field parameters.
3. At least one fully dry purge. A second dry purge may be necessary in some situations.

FIGURE 2
MONITORING WELL DATA SHEET

Site location:

ESC Project name/#:

Well Number	Depth to water surface (ft)	Depth to bottom of well (ft)	Length of water column (ft)	Volume of water evacuated (gal)	Time/date

Well Number	Temperature (^{0}F)	pH (S.U.)	Conductivity (Tmho/cm)	Time/Date

Well casing material / diameter:

Sampled by / signature:

NOTES / CALCULATIONS:

Except for low recovery wells, all wells are sampled within 6 hours of purging. Low recovery wells may be sampled as soon as sufficient sample matrix is available or up to 10 hours after purging. Wells that do not recover sufficiently within 10 hours should not be sampled.

Purging equipment includes Teflon® or stainless steel bailers or a peristaltic pump. Any fuel-powered pumping units are placed downwind of any sampling site. If purging equipment is reused, it is cleaned following standard procedures. Disposable latex gloves are worn by sampling personnel and changed prior to starting work at each sampling site.

If bailed water is determined to be hazardous, it should be disposed of in an appropriate manner.

The Florida Department of Environmental Regulation requires that during purging of the well, the purging device should be placed just below the surface of the water level and be lowered with the falling water level. For high yield wells, three casing volumes should be evacuated prior to collecting samples. Purging should be conducted at a rate to minimize agitation of the recharge water. Conductivity, pH, and temperature measurement during purging is necessary to monitor variability of the groundwater. **Samples should be collected within 6 hours of purging high yield wells.**

Low-yield wells (incapable of yielding three casing volumes) should be evacuated to dryness at a rate that does not cause turbulence. When the well recovers sufficiently, the first sample should be analyzed for pH, temperature, and conductivity. When recovery exceeds two hours, the sample should be collected as soon as sufficient volume is available. **If recovery is longer than 10 hours, the well should not be tested**. The project manager may wish to review available information to determine if obtaining a representative sample is possible.

9.4.1 Procedure for Well Evacuation: Teflon® Bailer

1. Clear the area around the well pad; cover with plastic if necessary.
2. Slowly lower the bailer to the water surface and remove it when full.
3. Reel or pull bailer to the surface using caution to not allow the lanyard (cable or string) to touch the ground.
4. Use the bailer volume and number of bails removed to determine volume of water removed. Excess hazardous material should be poured into a container for later disposal.
5. Repeat steps 2 and 3 until 1.5 well volumes have been removed.
6. Begin monitoring for pH, temperature, and conductivity. Record values on the Monitoring Well Data Sheet. Discard the sample into the collection pail. Purge until the change between samples of each parameter is less than 5%.
7. Continue until at least three well volumes have been evacuated and the parameters pH, temperature, and conductivity are within 5 percent, or until a low yield well has been evacuated to dryness.
8. Record date and time the well was purged on the Monitoring Well Data Sheet.

NOTE: For wells sampled in the State of Florida, three well volumes are purged prior to pH, temperature, and conductivity screening. Following evacuation of three well volumes, purge water is screened for these parameters at regular intervals until two consecutive measurements are within 5 percent. The intervals may be time-based (at least 5 min) or represent a portion of the well volume (at least 0.5 well volume).

Compliance with more stringent local, State, or Regional guidelines is observed where required.

9.4.2 Procedure for Well Evacuation: Peristaltic Pump

1. Clean area around the well pad.
2. Install the appropriate length of Tygon® or Teflon® tubing into the pump mechanism.
3. Insert the uncontaminated sampling end of the tubing into the well surface.
4. Connect the pump to the power supply.
5. Operate the pump at a flow rate that does not cause excessive agitation of the replacement water.
6. Determine the pump flow rate.
7. Purge until 1.5 well volumes have been evacuated.
8. Collect samples at a rate of one per well volume evacuated. Monitor these samples for pH, temperature, and conductivity. Record these measurements on the Monitoring Well Data Sheet. Monitor until the difference in each parameter is less than 5 percent.
9. Continue purging until three well volumes have been evacuated and the parameters pH, temperature, and conductivity are within 5 percent, or until a low yield well has been evacuated to dryness.
10. Record the date and time the well was purged on the Well Sampling Field Data Sheet.

9.5 PURGING TECHNIQUES: WELLS WITH IN-PLACE PLUMBING

9.5.1 General

The volume to be purged depends on whether the pumps are running continuously or intermittently and how close to the source samples can be collected. If storage/pressure tanks are present, a volume must be purged to totally exchange the volume of water in the tank.

9.5.2 Continuously Running Pumps

For continuously running pumps, the well should be purged by opening the valve and allowing it to flush for 15 minutes, if the well volume is unknown. If the sample is collected after a holding tank, the volume of the tank should also be purged.

9.5.3 Intermittently Running Pumps

Wells are purged at the maximum rate for at least 15 minutes. Monitoring of field parameters continues until two consecutive measurements within 5% are measured at 5-minute intervals.

9.6 SAMPLE WITHDRAWAL

Technique for withdrawal is dependent on the parameters to be analyzed. To collect a representative sample and minimize the possibility of sample contamination:

- Use Teflon® or stainless steel sampling devices when organics are an analyte of concern.
- Use dedicated tubing or samplers for each well. If a dedicated sampler is not available, clean the sampler between sampling events. Analyze equipment blanks to ensure cross-contamination has not occurred.

The preferred sample collection order is as follows (decreasing volatility):

1. Volatile organic compounds (VOCs)
2. Extractable Organics (includes Total Recoverable Petroleum Hydrocarbons [TRPH], Oil & Grease, Pesticides and Herbicides)
3. Total metals
4. Dissolved metals
5. Microbiological
6. Inorganics (includes Nutrients, demands, and Physical Properties)
7. Radionuclides

The following items are acceptable sampling devices for all parameters:

- A gas-operated, Teflon® or stainless steel squeeze pump (also referred to as a bladder pump with adjustable flow control) should be dedicated or completely cleaned between sampling events. If it is dedicated, the protocols on use, flow rates, and flow controls should be discussed.
- A Teflon® bailer with check valves and a bottom emptying device. Dedicated or disposable bailers should not be cleaned between purging and sampling operations.

ESC generally supplies sampling devices for wells sampled by ESC. However, some customers have wells equipped with dedicated sampling devices. All dedicated equipment is cleaned between sampling events with the exception of dedicated pump systems or dedicated pipes that are never removed. ESC evaluates the device and the project manager approves/disapproves of the dedicated device prior to sampling.

If sampling includes dissolved parameters, samples are filtered in the field in the following manner:

1. Use a one piece, molded, in-line high capacity disposable 1.0 micron filter when collecting samples for dissolved trace metals analysis. Use a 0.45 micron filter when sampling for all other (i.e., orthophosphorous, silica, etc.) dissolved parameters.
2. Filter material should be non-contaminating synthetic fibers.
3. Filter should be placed on the positive pressure side of the peristaltic pump.
4. If well is deeper than 25 feet; a submersible bladder pump may be necessary to bring the sample to the surface. Samples shall not be collected in an intermediate container.
5. At least one filtered equipment blank, using deionized water, must be collected and analyzed.
6. The sample is preserved as required following filtration.
7. Unfiltered samples are collected in conjunction with filtered samples.

NOTE: Filtered samples are collected only at the request of DER and will not be collected for turbid samples only.

9.6.1 Sample Removal: With In-Place Plumbing

Samples should be collected following purging from a valve or tap as near to the well as possible, and ahead of all screens, aerators, filters, etc. Samples shall be collected directly into the sampling containers. Flow rate should not exceed 500 mL/min.

9.6.2 Sample Removal: Without In-Place Plumbing

1. Following purging, collect the sample and pour it directly from the bailer into the sample container. If a peristaltic pump is used, pump the sample directly into the container. Collect the samples in order of decreasing volatility.
2. Measure the conductivity, pH, and temperature of the samples and record the results on the Monitoring Well Data Sheet.
3. If a bailer is not dedicated, clean field equipment using standard procedures. Collect blanks at a rate of one per type of equipment cleaned. If a piece of equipment is cleaned more than twenty times, collect blanks at a rate of 10 percent. An equipment blank must be taken and preserved for each analyte method group.
4. If a bailer is used to collect samples, replace the bailer string. Take precautions not to allow the string to touch the ground. Dispose of the used string properly. If Teflon® or stainless steel cable is used, clean according to standard procedures and do not let it touch the ground.
5. Replace the well cap and close and lock the protective casing lid.

9.7 SPLIT AND DUPLICATE SAMPLE COLLECTION

Split samples measure variability between analysts, methods, and laboratories and are taken as subsamples from a single sample. Duplicate samples measure variability inherent in the collection method or waste stream and are obtained in close succession during the same sampling event.

9.7.1 Split Sample Collection

1. Collect sufficient volume in a container constructed of appropriate materials. The volume should be more than twice the volume required for one sample.
2. Preserve as necessary.
3. Mix well.
4. Alternately decant 10% of the sample volume into each container and mix well.
5. Continue until each container is filled with an adequate sample volume.
6. Seal the containers, assign a field number, and complete the chain of custody.

9.7.2 Duplicate Sample Collection

1. Collect two samples in rapid succession into separate containers.
2. Preserve as necessary.
3. Mix well.
4. Seal the containers, assign a field number, and complete the chain of custody.

9.8 DRINKING WATER SAMPLING

9.8.1 General Concerns

Containers and preservatives must be selected prior to sampling.

- Containers and preservatives shall comply with Tables 1 and 2.
- It is recommended that the appropriate preservative be added to the container by the laboratory.

9.8.2 Sampling Drinking Water Wells

1. Purging and sampling should be from a spigot closest to the wellhead.
   - The spigot should be located before the holding tank and filters. If this is not possible, the holding tank must also be purged.
   - All aerators and filters should be removed if possible.
2. Depending on the running schedule of the well and the placement of the pressure tank, the system is purged as described in Section 9.5.
3. If volume of the pressure tank is not known, the well is purged for at least 15 minutes at maximum rate.
4. The flow is reduced to approximately 500 mL/minute.

5. Sample containers with no preservatives:
   - The interior of the cap or the container should not come in contact with anything.
   - The sample container is rinsed and the water is discarded.
   - Containers are not rinsed if collecting for oil and grease, total recoverable hydrocarbons, volatile organics (including trihalomethanes) or microbiologicals.
   - The container should be tilted to minimize agitation.
6. Sample containers with preservatives:
   - The above protocol is followed but **DO NOT** rinse the container.
   - The open end of the container should be held away from the face while filling.
   - The container should be gently tipped several times to mix the preservatives.
7. Place the bottle in a plastic bag and cool to 4°C.

9.8.3 Sampling Drinking Water within a Facility/Residence for the Lead/Copper Rule

1. The appropriate sampling point depends on whether the sample is being taken to monitor compliance with Drinking Water Regulations for Lead and Copper. If so, the sample must be taken from a cold water tap in the kitchen or bathroom of residential housing or from an interior tap where water is used for consumption in a non-residential building.
2. Samples must be collected after the water has stood in the pipes for at least six hours.
3. THE SYSTEM SHOULD NOT BE FLUSHED.
4. The first flush should be collected immediately into the sample container. DO NOT RINSE THE CONTAINER PRIOR TO COLLECTING THE SAMPLE.
5. The container should be tilted to minimize agitation.
6. If the container contains preservative, hold the open end away from the face.
7. If the container does not contain preservative, add preservative as needed.
8. Replace cap and gently tip the container several times to mix the preservatives.
9. Place in a plastic sample bag.

9.8.4 Sampling a Lead Service Line in a Facility/Residence for the Lead/Copper Rule

1. When sampling for compliance, the sampling point is normally designated by the permit or the municipality.

2. For Lead & Copper samples, each sample shall have stood in the line for at least six hours and shall be collected in one of the following ways:
   a. At the tap, after flushing the volume of water between the tap and the lead service line. The volume of water shall be calculated based upon the inner diameter and length of the pipe between the tap and the service line.
   b. By tapping directly into the service line.
   c. In a single-family residence, allow the water to run until a significant temperature change indicates water standing in the service line is being sampled.
3. The flow shall be reduced to less than 500 mL/min before collecting samples.
4. Test for the presence of residual chlorine using residual chlorine indicator strips or a Hach DR-100 chlorine analyzer.
5. If residual chlorine is present and the parameter being analyzed requires removal of chlorine, collect the sample in the appropriate sample container(s) using the required preservatives.
   a. Add 0.008% $Na_2S_2O_3$ or 100mg of $Na_2S_2O_3$ per 1L of sample water directly into the sample container.
   b. After replacing the cap, tip the container several times to mix the preservative.

10.0 SOIL SAMPLING

Soil samples are preserved as per Section 14. When compositing subsamples, the quantity of each subsample used is measured and recorded in the field logbook.

10.1 SAMPLING EQUIPMENT

Type	Use	Materials	Allowable Parameter Groups[1]
Hand Auger (Bucket type)	Sampling	PVC	All parameter groups except VOC's, extractables and organics
Encore™ Sampler	VOC soil subsampling	Teflon®	VOC's only
Split Spoons	Sampling	Carbon Steel	All parameter groups
Trowel, Spatula	Sampling and Compositing*	Chrome-Plated Steel	All parameter groups
Spoons	Sampling and Compositing*	Stainless Steel	All parameter groups
Shovel	Sampling	Carbon Steel	All parameter groups
Mixing Pan	Compositing*	Pyrex & Aluminum	All parameter groups except metals in aluminum pan

[1] Carbon steel & Chrome-plated steel tools may be used for collecting soils where trace metal concentrations are not a concern. When these tools are used, samples should be taken from soils not in contact with the tool surface.

* Compositing is not suitable for VOC's

10.2 HAND AUGER SAMPLING PROCEDURE

This procedure is used when only relatively shallow samples are required or when the use of heavy equipment is not practical. The hand auger may be used to collect samples of soils or other materials at various depths by adding extensions as necessary.

1. Remove surface debris from the location of the sampling hole using a clean shovel or spoon.
2. Disturbed portions of soil should be discarded and not used as part of the sample.
3. Using a clean auger, drill to the desired sample depth. Confirm depths using a tape measure or other appropriate device.
4. Use a clean planer auger to clean and level the bottom of the boring.
5. All grab samples should be mixed thoroughly prior to placement in containers (except VOCs).
6. Using a clean auger, extract the desired sample. Subsampling is performed for VOC sample collection using an Encore™ sampling device. Once the core sample is collected, additional samples should be taken using an Encore™ sampler, either 5g or 25g, capped, sealed, and immediately cooled to 4ºC. The holding time for this method is 48 hours. Alternatively, weigh 5g of sample into a pre-weighed vial (with a Teflon® lined screw cap) containing 5mL sodium bisulfate solution and a magnetic stir bar, cap, and then ice to 4ºC. The holding time for this method is 14 days.
7. If less than the collected volume of material is desired or if multiple containers are required, subsampling shall be conducted. The collected material shall be placed in a clean mixing pan and thoroughly mixed using a clean, stainless steel spoon. The mixed material will then be quartered, removed and recombined before samples are collected. For clay soils, representative aliquots of the entire sample should be removed from the auger using stainless steel spoons. Samples for chemical analyses shall not be collected from auger flights or cuttings from hollow stem auger flights. Samples used for vapor meter determinations will not be used for trace contaminant analyses.
8. Samples should then be labeled. The depth range from which the samples were taken should be included in the sample description.
9. Repeat steps (2) through (6) as necessary to obtain samples at all desired depths.
10. When preparing composite samples, the quantity of each subsample shall be measured and recorded in the field logbook.

10.3 SPLIT AND DUPLICATE SAMPLE COLLECTION

Split samples measure variability between analysts, methods, and laboratories and are taken as subsamples from a single sample. This is unlike duplicate samples that measure variability inherent in the collection method or waste stream and are obtained in close succession during the same sampling event. True split samples are difficult to collect for soils, sediment, and sludge under field conditions. Split samples for these materials are therefore considered duplicate samples.

The collection procedure is as follows:

1. Collect the appropriate volume of sample into a clean disk constructed of a non-reactive material.
2. Mix the material with a clean utensil and separate into 4 to 10 equal portions.
3. Alternate placing a portion of the subdivided material into each container.
4. Repeat until each container is filled.
5. Assign each container a field sample number and complete the chain of custody.

11.0 WASTE SAMPLING

11.1 SAMPLING EQUIPMENT

Type	Use	Materials	Allowable Parameter Groups[1]
Shovel	Sampling	Carbon Steel	All parameter groups except metals
Split Spoons	Sampling	Carbon Steel	All parameter groups except metals
Trowel, Spatula	Sampling and Compositing*	Stainless Steel	All parameter groups
Spoon	Sampling and Compositing*	Stainless Steel	All parameter groups
Drum Pump	Sampling	Polypropylene	All parameter groups
Mixing pan	Compositing*	Pyrex or aluminum	All parameter groups except metals in aluminum pan
Coliwasa	Sampling	Glass	All parameter groups

[1]Carbon steel tools may be used for collecting wastes when trace metal concentrations are not a concern.
*Compositing is not suitable for VOC's

11.2 GENERAL

This section discusses the collection of samples from drums, tank trucks, and storage tanks, and samples from waste piles and landfills. All ESC personnel consider sampling from closed containers as a hazardous operation.

11.2.1 Specific Quality Control Procedures for Sampling Equipment

Sampling equipment used during waste sampling must be cleaned as specified in Section 12 of this manual before being returned from the field to minimize contamination.

Contaminated disposable equipment must be disposed of as specified in the sampling plan.

All field equipment is cleaned and repaired before being stored at the conclusion of a field study. Special decontamination procedures may be necessary in some instances and is developed on a case-by-case basis. Any deviation from standard cleaning procedures and all field repairs is documented in field logbooks. Equipment that has not been properly cleaned must be tagged and labeled.

11.2.2 Collection of Supplementary Information

The collection of supplementary data is important when collecting waste samples. Any field analyses are recorded in field logbooks. Sketches of sampling locations and layout are documented in the logbooks. Photographs are used extensively.

11.3 Open and Closed Container Sampling

11.3.1 General

When sampling containers, open containers should be sampled first since they generally present less of a hazard. Closed containers must be considered as extremely hazardous. Due to the dangers involved with container sampling, the sampling of drums or other containers containing either unknown materials or known hazardous materials are considered a hazardous duty assignment.

One problem with container sampling is stratification and/or phase separation. Care must be taken to ensure that the sample collected is representative. If only one layer or phase is sampled, this should be noted when interpreting analytical results.

If no stratification is present, representative samples may be composited by depth. When a drum or cylindrical container is standing vertically, depth compositing provides a good quantitative estimate of the containers contents. In other cases where containers are tipped, horizontal, deformed, etc., and stratification may not be present, vertical compositing provides at least a qualitative sample.

11.3.2 Sampling Equipment

The following equipment is available for use in collecting waste samples: barrel bung wrenches, adjustable wrenches, etc.; coliwasa samplers for drum sampling; and peristaltic pumps for liquid waste sampling from containers.

11.3.3 Sampling Techniques

Containers containing unknown materials or known hazardous materials are opened using only spark proof opening devices from a grounded container.

The coliwasa sampler is a single use glass sampler, consisting of an outer glass tube with one end tapered and a separate inner glass tube with a small bulb on one end. The outer tube is slowly lowered into the drum, tapered end first. Slowly lowering the tube allows the liquid phases in the drum to remain in equilibrium. The inner glass tube is inserted into the outer tube. After both inner and outer tubes are inserted into the drum to be sampled, the inner tube bulb end is pressed gently against the tapered end of the outer tube, forming a seal. Both tubes are withdrawn from the drum and the ends of the tubes are held over the sample container.

Drum samples can also be collected using a length of glass tube (1/2-inch or less inside diameter). The tube is inserted into the drum as far as possible and the open end is sealed to hold the sample in the tube. The sample is then placed in the appropriate container. Sample volumes are the absolute minimum required.

Tank truck and storage tank samples may be collected from access ports on top of these tanks or trucks using the above techniques. Tank trucks are often compartmentalized, and each compartment should be sampled. Sampling from discharge valves is not recommended due to stratification possibilities and possibilities of sticking or broken valves. If the investigator must sample from a discharge valve, the valving arrangement of the particular tank truck being sampled must be clearly understood to ensure that the contents of the compartments of interest are sampled. The investigator must realize that samples obtained from valves may not be representative.

If stratification or phase separation of waste samples is suspected, the sample collected should be representative of container contents. Samples should be depth composited when possible and number and types of layers shall be noted when interpreting analytical results.

11.4 WASTE PILES AND LANDFILLS

11.4.1 General

Waste piles consist of sludge and other solid waste, liquid waste mixed with soil, slag, or any type of waste mixed with construction debris, household garbage, etc. The sampling personnel must be aware that landfills were not and are often still not selective in the types of materials accepted. Sampling at landfills could involve sampling operations that are potentially dangerous to sampling personnel.

11.4.2 Sampling Locations

Sampling locations should be selected that yield a representative sample of the waste. Exceptions are situations in which representative samples cannot be collected safely or when the team is purposely determining worst-case scenarios.

11.4.2.1 Waste Piles

A representative sample from a small waste pile can be obtained by collecting a single sample. Collecting representative samples from large waste piles requires a statistical approach in selecting both the numbers of samples and sample location. A discussion of statistical methods is outlined in the *Test Methods for Evaluating Solid Waste (SW-846)* issued by the EPA Office of Solid Waste and Emergency Response.

11.4.2.2 Landfills

Representative samples from landfills are difficult to achieve to due to the heterogeneous nature of the wastes. A statistical approach should be used in selecting both the number of samples and the sample location. Statistical methods are given in *Test Methods for Evaluating Solid Waste (SW-846)* issued by the EPA Office of Solid Waste and Emergency Response. Landfills often generate leachate at one or more locations downgradient of the fill material that can provide some insight into the materials contained in a landfill that are migrating via groundwater.

11.4.3 Sampling Techniques

All samples collected should be placed into a Pyrex® or aluminum mixing pan and mixed thoroughly. Samples for volatile organic compounds analyses must not be mixed or composited. Stainless steel spoons or scoops should be used to clear away surface materials before samples are collected. Near surface samples can then be collected with a clean stainless steel spoon. Depth samples can be collected by digging to the desired depth with a carbon steel shovel or scoop and removing the sample with a stainless steel spoon.

12.0 STANDARD CLEANING PROCEDURES

12.1 GENERAL

12.1.1 Introduction

ESC personnel use the procedures outlined in this section to clean field equipment prior to use. Ideally, a sufficient amount of clean equipment is carried to the field so that the project can be conducted without the need for field cleaning. This is not always the case. ESC's policy regarding cleaning field equipment is as follows:

1. Equipment used in the field must be thoroughly cleaned in a controlled environment using prescribed procedures. This minimizes the potential for contaminants being transferred to equipment, vehicles, and the laboratory.
2. All equipment is rinsed immediately with tap water after use, even if it is to be field cleaned for other sites.
3. If equipment is used only once (i.e., not cleaned in the field), it is labeled as “dirty or “contaminated equipment in the field and transported separately from clean equipment.
4. All cleaning procedures are documented. Field decontamination is documented in the field records. These records specify the type of equipment cleaned and the specific protocols that are used. In-house cleaning records must identify the type of equipment, date it was cleaned, SOP used, and person that cleaned it.
5. Unless justified through documentation (i.e., company written protocols and analytical records) and historic data (i.e., absence of analytes of interest in equipment blanks), the protocols in Sections 12.1.2 through 12.7.11 are followed without modification.
6. All field sampling equipment is pre-cleaned in-house.

12.1.2 Cleaning Materials

Use a phosphate-free, laboratory detergent such as Liquinox®. The use of any other detergent is noted in field logbooks and summary reports.

Ten percent nitric acid solution is made from reagent-grade nitric acid and deionized water.

The standard cleaning solvent used is pesticide-grade isopropanol. Other solvents (acetone and/or hexane) may be substituted as necessary. The use of other solvents must be documented in field logbooks and summary reports.

Tap water may be used from any potable water system. Untreated water is not an acceptable substitute for tap water.

Deionized water is tap water that has been passed through a deionizing resin column and should contain no inorganic compounds at or above analytical detection limits. Organic-free water is tap water that has been de-ionized and treated with activated carbon. Organic-free water should contain no detectable levels of organic compounds, and less than 5 ug/L of VOCs.

Analyte-free water is water in which all the analytes of interest and all interferences are below the method detection limits. Analyte-free water is always used for blank preparation and for the final in-house decontamination rinse.

Substitution of a higher grade water (i.e., deionized or organic-free water for tap water) is permitted and need not be recorded. Solvent, nitric acid, detergent, and rinse water used to clean equipment shall not be reused.

12.1.3 Marking Clean Equipment

Equipment that is cleaned by these methods is marked with the date and time that the equipment was cleaned.

12.1.4 Marking Contaminated or Damaged Field Equipment

Field equipment that needs repair is tagged and repairs or symptoms noted on the tag. Field equipment that needs cleaning **will not** be stored with clean equipment. All wrapped equipment not used in the field may be placed back in stock after equipment is inspected to ensure that contamination has not taken place.

12.1.5 Decontamination of Equipment Used With Toxic or Hazardous Waste

Equipment used to collect hazardous or toxic wastes or materials from hazardous waste sites, RCRA facilities, or in-process waste streams is decontaminated prior to leaving the site. This decontamination procedure consists of washing with laboratory detergent and rinsing with tap water. More stringent procedures may be required depending on the waste sampled.
If equipment is heavily contaminated, an acetone or acetone/hexane/acetone pre-rinse may be necessary prior to regular decontamination procedures. It is not recommended that this type of cleaning be performed in the field.

12.1.6 Disposal of Cleaning Materials

See Section 16.

12.1.7 Safety Procedures for Cleaning Operations

All applicable safety procedures are followed during cleaning operations. The following precautions are taken during cleaning operations:

- Safety glasses or goggles, gloves, and protective clothing are worn during all cleaning operations.
- Solvent rinsing operations are conducted under a hood or in an open, well ventilated area.
- No eating, smoking, drinking, chewing, or hand to mouth contact is permitted during cleaning operations.

12.1.8 Storage of Field Equipment

All clean field equipment is stored in a designated, contaminant-free area.

12.2 Quality Control Procedures for Cleaning

12.2.1 General

This section establishes quality control methods to monitor the effectiveness of the equipment cleaning procedures. The results of these methods are monitored by the ESC Quality Assurance Department. All quality control procedures are recorded in a logbook and maintained in a quality assurance file. If contamination problems are detected, the ESC QA Department determines the cause(s) of the problem(s) and takes immediate corrective action.

12.2.2 Rinse Water

The quality of water used is monitored once per quarter by placing water in standard, pre-cleaned sample containers and submitting them to the ESC laboratory for analysis. Organic-free water is also submitted for analyses of the various organic compounds.

12.3 Procedures for Cleaning Teflon® or Glass Equipment Used in the Collection of Samples for Trace Organic Compounds and/or Metals Analyses

1. Equipment is washed with laboratory detergent and hot water using a brush to remove any particulate matter or surface film. If oil, grease, or other hard to remove residues are present on the equipment, an acetone/hexane/acetone pre-wash and/or steam cleaning may be necessary.
2. Rinse the equipment with hot tap water.
3. Rinse or soak, if necessary, equipment with a 10% nitric acid solution. If nitrogen-containing compounds are analytes of concern, hydrochloric acid must be used as a substitute or subsequent equipment rinse.
4. Rinse equipment with tap water.
5. Rinse equipment with deionized water.
6. Rinse equipment twice with solvent and allow to dry.
7. If equipment cannot be cleaned effectively, discard properly.
8. Wrap equipment in aluminum foil. Seal in plastic and date.

12.4 Procedures for Cleaning Stainless Steel or Metal Sampling Equipment Used in Trace Organic and/or Metals Sample Collection

1. Equipment is washed with laboratory detergent and hot water using a brush to remove any particulate matter or surface film. If oil, grease, or other hard to remove materials are present, a acetone/hexane/acetone pre-wash and/or steam cleaning may be necessary.

2. Rinse equipment with hot tap water.
3. Rinse equipment with deionized water.
4. Rinse equipment twice with solvent and allow to dry.
5. If equipment cannot be cleaned effectively, discard properly.
6. Wrap equipment in aluminum foil. Seal in plastic and date.

12.5 CLEANING PROCEDURES FOR AUTOMATIC SAMPLING EQUIPMENT

12.5.1 General

All automatic wastewater samplers are cleaned as follows:

- The exterior and accessible interior portions of automatic samplers is washed with Liquinox and rinsed with tap water.
- The electronics casing are cleaned with a clean damp cloth.
- All vinyl sample tubing is discarded after each use.
- Teflon® tubing is cleaned using procedures found in Section 12.6.2.
- Silastic pump tubing is cleaned after each use, if possible. Tubing is cleaned using cleaning procedures specified in Section 12.6.1 of this document. Tubing is checked on a regular basis and will be changed if it has become discolored or loses elasticity.

12.5.2 Reusable Glass Composite Sample Containers

1. If containers are used to collect samples that contain hard to remove materials (i.e., oil and grease) it is rinsed as necessary with reagent grade acetone prior to the detergent wash. If material cannot be removed, the container is discarded.
2. Wash containers thoroughly with hot tap water and Liquinox and rinse thoroughly with hot tap water.
3. If metals are to be sampled, rinse with 10% nitric acid. If nutrients are to be sampled, follow with a 10% hydrochloric acid rinse.
4. Rinse thoroughly with tap water.
5. Rinse thoroughly with DI water.
6. If organics are to be sampled, rinse twice with isopropanol and allow to air dry for 24 hours or more. Cap the container with the decontaminated Teflon® lined lid.
7. After use, rinse with tap water in the field and cover to prevent drying of material onto the interior surface.
8. Containers that have a visible scale, film, or discoloration after cleaning or were used at a chemical manufacturing facility should be properly discarded at the conclusion of the sampling activities.

12.5.3 Reusable Plastic Composite Sample Containers

1. Wash containers with hot tap water and laboratory detergent using a bottlebrush to remove particulate matter and surface film.
2. Rinse containers with hot tap water.
3. Rinse containers with 10% nitric acid. If nitrogen containing compounds are analytes of concern, hydrochloric acid must be used as a substitute or subsequent equipment rinse.
4. Rinse containers with tap water.
5. Rinse containers with deionized water.
6. Cap with aluminum foil.
7. Plastic sample containers used at facilities that produce toxic compounds will be properly disposed of at the conclusion of the sampling activities. Containers that have a visible film, scale, or other discoloration remaining after cleaning will be discarded.

12.5.4 Plastic Sequential Sample Bottles for Automatic Sampler Base

1. Rinse bottles in field with potable or de-ionized water when possible.
2. Wash in dishwasher at wash cycle, using laboratory detergent cycle, followed by tap and deionized water rinse cycles. Alternatively, handwash using the same procedure.
3. Rinse with 10% nitric acid. If nitrogen containing compounds are analytes of concern, hydrochloric acid must be used as a substitute or subsequent equipment rinse.
4. Rinse with tap water.
5. Replace bottles in sampler base; cover with aluminum foil before storing.

12.6 CLEANING PROCEDURES FOR SAMPLING TUBING

12.6.1 Silastic Rubber Pump Tubing Used In Automatic Samplers

Silastic pump tubing used in automatic samplers need not be replaced in pumps where the sample does not contact the tubing, where the sampler is being used solely for purging purposes (i.e., not being used to collect samples). Tubing must be changed on a regular basis, if used for sampling purposes, and should be cleaned in this manner:

1. Flush tubing with laboratory grade detergent and hot tap water
2. Rinse thoroughly with hot tap water
3. Rinse thoroughly with DI water
4. If used to collect metals samples, the tubing is flushed with 1+5 nitric acid, followed by a thorough rinsing with DI water
5. Install the tubing in the automatic wastewater sampler
6. Cap both ends with aluminum foil or equivalent

Tubing should always be replaced at automatic sampler manufacturer's recommended frequencies. If tubing cannot be adequately cleaned, it is discarded.

12.6.2 Teflon® Tubing

New Teflon® tubing is pre-cleaned as follows:

1. Rinse outside of the tubing with pesticide-grade solvent.
2. Flush interior of the tubing with pesticide-grade solvent.
3. Let dry overnight in drying oven or equivalent.
4. Wrap tubing in aluminum foil and seal in plastic.

Reused tubing is transported to the field in pre-cut and pre-cleaned sections. Field cleaning of Teflon® is not recommended. The following steps describe in-house cleaning procedures:

1. Exterior of tubing must be cleaned first by soaking in hot, soapy water in a stainless steel or non-contaminating sink. Particulate may be removed with a brush.
2. Clean inside of tubing ends with a small bottlebrush.
3. Rinse surfaces and ends with tap water.
4. Rinse surfaces and ends with nitric acid, tap water, isopropanol, and analyte-free water.
5. Place on fresh aluminum foil, connect all sections with Teflon® couplings.
6. Cleaning configuration:
   a. Cleaning solutions are placed in a clean, 2-liter glass jar.
   b. Place one end of tubing in the solution, the other in the **INFLUENT** end of a peristaltic pump.
   c. Effluent from the pump can be recycled through the glass cleaning solution jar. All cleaning solutions can be recycled EXCEPT the final isopropanol and analyte-free water rinses.
7. The above configuration is used as follows:
   a. Pump generous amounts of hot, soapy water through the tubing.
   b. Follow this with tap water, 10% nitric acid, tap water, isopropanol, and analyte-free water.
   c. The nitric acid and isopropanol rinses should be allowed to remain in the tubing for 15 minutes with the pump shut off then continue with subsequent rinses
   d. Leave any couplings in and connect or cover the remaining ends.
8. After cleaning the interior, rinse the exterior with analyte-free water.
9. The cleaned lengths are wrapped in aluminum foil and stored in a clean, dry area until use.

12.7 FIELD EQUIPMENT CLEANING PROCEDURES

12.7.1 General

It is the responsibility of field personnel to properly clean equipment in the field. The following procedures are observed when cleaning equipment in the field.

12.7.2 Conventional Equipment Use

Remove deposits with a brush if necessary. If only inorganic anions are of interest, equipment should be rinsed with analyte-free water and with the sample at the next sampling location prior to collection. Clean equipment for the collection of samples for organic compounds or trace inorganic analyses according to Section 12.7.3.

12.7.3 Equipment Used to Collect Organic Compounds and Trace Metals Samples

1. Clean with tap water and laboratory detergent. If necessary, use a brush to remove particulate and surface films then rinse with tap water.
2. Rinse with 10 to 15% nitric acid solution followed by 10% hydrochloric acid rinse (unless equipment is made of metal) followed by tap water and DI water.
3. Rinse twice with solvent.
4. Rinse with organic-free water and allow to air dry.
5. If organic-free water is unavailable, let air dry. Do not rinse with deionized or distilled water.
6. Wrap with aluminum foil or plastic.

12.7.4 Teflon®, Glass, Stainless Steel or Metal Equipment Used to Collect Samples for Metal Analyses

1. Remove particulate matter and surface films. Clean with laboratory detergent and tap water.
2. Rinse with tap water.
3. Ten percent nitric acid solution (skip 3 and 4 if equipment is made of metal and/or stainless steel).
4. Rinse with tap water.
5. Rinse with deionized water then let air dry.

12.7.5 Instruments Used to Measure Groundwater Levels

1. Wash with laboratory detergent and tap water.
2. Rinse with tap water.
3. Rinse with deionized water.
4. Allow to dry.

12.7.6 Field Filtration Apparatus

1. A new, disposable filtration unit will be used for each site. Filter pore size is dependent on parameter being monitored as per Section 9.6.
2. The peristaltic pump is cleaned as described in Section 12.7.7.
3. Silastic pump tubing is cleaned as described in Section 12.6.1.
4. If Teflon® tubing is used, it is cleaned as described in Section 12.6.2.
5. Other tubing types must be cleaned following the appropriate regimen described in Section 12.6. In general, non-Teflon® type tubing (e.g., HDPE) will not be re-used.

12.7.7 Flow Meters, Above Ground Pumps, Bladder Pumps and Other Field Instrumentation

The exterior of equipment such as flow meters should be washed with a mild detergent and rinsed with tap water before storage. The interior of such equipment may be wiped with a damp cloth.

Other field instrumentation should be wiped with a clean, damp cloth. Meter probes should be rinsed with deionized water before storage.

Equipment desiccant should be checked and replaced as necessary.

Peristaltic pumps used for purging must be free of oil and grease on the exterior. They must be cleaned on the outside with Liquinox and rinsed with tap water followed by DI water.

12.7.8 In-Field Decontamination For Submersible Purging Pump and Tubing

ESC uses the submersible bladder pump listed in Section 9.1 only for purging and not for sample collection. The pump and tubing is decontaminated between wells in the following manner:

1. Interior of the pump and tubing is thoroughly flushed with a soapy water solution.
2. Wipe or scrub the exterior of the pump and tubing as necessary with the appropriate soap solution.
3. Rinse exterior and interior of pump and tubing thoroughly with tap water followed by a deionized water rinse.
4. Allow remaining water to drain from tubing and pump and allow to air dry as long as possible in a contaminant free area before purging the next well.

12.7.9 Shipping Containers

All reusable shipping containers are washed with laboratory detergent, rinsed with tap water, and air dried before storage or re-use. Extremely contaminated shipping containers are cleaned as thoroughly as possible and properly disposed.

12.7.10 Analyte Free Water Containers

Analyte-free water containers can be made of glass, Teflon®, polypropylene, or high density polyethylene (HDPE). Inert glass or Teflon® are recommended for holding organic-free sources of water. Polypropylene can be used when organics are not analytes of concern. HDPE is not normally recommended but is acceptable for use. Water should not be stored in these containers for extended periods. Containers of water should only be used for a single event and should be disposed of at the end of the sampling day. The procedure for cleaning analyte-free water containers is as follows:

1. For new containers, follow instructions in Section 12.3 of this manual. Delete the solvent rinse if containers are made of plastic.
2. Cap with Teflon® film, aluminum foil, or the Teflon® lined bottle cap (aluminum foil or Teflon® film may also be used as a cap liner).

If water is being stored in reused containers, the following cleaning procedures should be followed:

1. After emptying, cap the container.
2. Wash exterior of the container with Liquinox and rinse with DI water.
3. Rinse the interior twice with isopropanol unless the container is made of plastic.
4. Rinse the interior thoroughly with analyte-free water.
5. Invert and allow to dry.
6. Fill the container with analyte-free water and cap with aluminum foil, Teflon® film, or a Teflon® lined bottle cap.
7. Water is not stored prior to a sampling event for more than 3 days.

12.7.11 Vehicles

Field vehicles used by ESC personnel should be washed at the conclusion of each sampling event. This should reduce the risk of contamination due to transport on a vehicle. When vehicles are used at hazardous waste sites or on studies where pesticides, herbicides, organic compounds, or other toxic materials are known or suspected to be present, a thorough interior and exterior cleaning is mandatory at the conclusion of the site visit.

Vehicles are equipped with trash containers. ESC personnel are responsible for cleanliness of each vehicle.

13.0 SAMPLE HISTORY

Sample chronology is recorded and kept on the ESC chain of custody, field logbooks and laboratory notebooks. These are discussed in detail in Section 9.0.

14.0 SAMPLE CONTAINERS, PRESERVATION METHODS AND HOLDING TIMES

14.1 GENERAL CONSIDERATIONS

The following section contains information regarding sample containers, preservation methods, and holding times. Refer to SW-846, Table II-1 and Chapter 3, Page 3 for solid waste and RCRA projects and 40 CFR Part 136, Table II for water and wastewater projects.

The provisions of 40 CFR Part 136, Table II take precedence over requirements given in any approved method when sampling in the State of Florida for water and wastewater.

Proper sample preservation is the responsibility of the sampling team and it is their responsibility to assure that all samples are preserved according to 40 CFR Part 136. For the purposes of this manual, "immediately" is defined as within 15 minutes.

Sample preservation is accomplished either by obtaining pre-preserved containers from an acceptable source or by adding preservatives in the field.

It is the responsibility of the field team accepting pre-preserved containers to make sure that the proper preservatives are used and desired results are achieved. The laboratory also supplies additional preservatives from the same source in suitable containers.

14.2 SAMPLE PRESERVATION

The following protocols apply for sample containers preserved in the field after the sample has been added:

1. Preservatives are at least reagent grade or higher. The acid for metals is suitable for trace metals analyses.
2. Fresh preservatives are obtained prior to each sampling event. Remaining preservatives that are not sealed must be discarded in an acceptable manner.
3. Preservatives are transported in pre-measured glass ampules and added directly to the sample.
4. A corresponding amount of preservative is added to the associated equipment blanks.
5. The pH is checked on all pH preserved samples with the exception of VOC, oil and grease, and TRPH.

Effectiveness of pH adjustment is made in the following manner:

1. Narrow range pH paper is used to test a small aliquot of the preserved sample.
2. A small portion of sample is placed into a container, checked with pH paper, and compared against the color chart.
3. Discard the aliquot properly, but do not pour back into the sample container.
4. If pH is acceptable, document in field log and prepare for transport to laboratory.

If pH is unacceptable, continue to add additional preservative in measured increments using the methods described above until an acceptable pH has been reached. Record the total amount of preservative used in the field log. Always use additional preservative from the same source as the initial preservation attempt.

In some cases, an extra dummy sample can be used to test pH preservation. Content should be suitably discarded.

If equipment blanks or field blanks are used, the maximum amount of preservative that was used to preserve any single sample in the set is added to the equipment or field blank.

Samples requiring temperature preservation are cooled to 4°C. The cooler will be checked to ensure that the ice has not melted.

14.3 SAMPLE CONTAINERS

ESC does not clean and re-use sample containers. ESC purchases all sample collection containers precleaned. All used sampling containers are discarded after use. The cleaning criteria of all containers must meet EPA analyte specific requirements.

QEC provides written certification that containers do not contain analytes of concern above method detection levels

ESC maintains records for these containers (lot numbers, certification statements, date of receipt, etc.) and intended uses are documented.

14.4 FIELD REAGENT HANDLING

Reagents, cleaning materials, and preservatives that are maintained by a field team will be stored, transported, and handled in such a way as to prevent and/or minimize contamination. The following storage and use protocols will be observed:

1. Chemicals are stored in-house and transported to the field segregated by reactivity.
2. Acids are stored in an acid storage cabinet and solvents are stored in a vented, explosion proof solvent storage cabinet.
3. All chemicals transported to the field are stored in bottles and packed to avoid breaks.

4. When reagents are transferred from an original container, the transport container must be pre-cleaned and of compatible material as the original container.
5. Chemicals are separated from sample containers and samples to avoid reaction and possible contamination.
6. Analyte free water is segregated from solvents to prevent contamination.

14.4.1 Reagent and Standard Storage

Chemical	Method of Storage
Nitric acid	Stored separated from other acids in original container in vented cabinet.
Sulfuric acid	See above
Hydrochloric acid	See above
Isopropanol	Stored in original glass container in vented and explosion proof solvent storage cabinet.
pH calibration buffers, turbidity standards, conductivity standards	Stored in cabinet designated for standard and reagent storage. Stored in temperature-controlled area of laboratory.
Sodium hydroxide	Stored in original container in designated cabinet in laboratory.
Sodium thiosulfate, zinc acetate, ascorbic acid, lead acetate	Stored in original containers in designated area of laboratory. Reagent solutions made fresh prior to use.

14.5 SAMPLE TRANSPORT

In the majority of situations, samples are delivered directly to the laboratory by the field sampling team or field courier following standard chain of custody protocols. Samples are preserved immediately (i.e., within 15 minutes) and packed with ice prior to transport. The field team relinquishes custody to the login sample custodian upon arrival at the laboratory.

Certain situations require that the field sampling team ship samples to the laboratory utilizing common carrier (UPS, FEDEX, etc.). If samples are sent by common carrier, all documentation (transmittal form, chain of custody, field data, analyses request, etc.) is placed in a ziplock bag and placed inside the sample container. The container is then sealed closed and sent to the laboratory in the required time frame to meet requirements of time-sensitive analyses.

14.6 BIOMONITORING SAMPLING

Preservation and Sample Volume

Aqueous samples collected for Bioassay can be collected in either glass or HDPE plastic. There is no required chemical preservation for this type of sample but the sample must be kept at 4 ± 2°C. The required volume varies independently with each type of analysis but the minimum collected is 250mL. The samples can be held for a maximum of 36 hours from the time of collection until first use.

Sample Collection

Grab sample protocols are utilized for acute bioassay unless otherwise specified in permit requirements. Composite sampling protocols are utilized for chronic bioassays unless otherwise specified in permit requirements. (Actual sampling protocols are discussed in detail throughout this appendix) ESC field collection personnel are required to collect all bioassay samples by completely filling the sample bottle and leaving no headspace. It is important that bottles be filled completely to reduce possible aeration that may reduce the toxic properties of the sample. If a customer chooses to collect the samples, a trained ESC field collection person can explain in detail the importance of reducing aeration by filling the sample bottle completely.

14.6.1 Biomonitoring Sampling Containers

All bioassay glassware are cleaned using the following EPA protocol:

- soak for 15 minutes in hot tap water with detergent and scrub
- rinse thoroughly with hot tap water
- rinse thoroughly with dilute nitric acid (10%)
- rinse thoroughly with deionized water
- rinse thoroughly with pesticide grade acetone

Footnotes:

1) Matrix - NPW=Nonpotable Water, PW= Potable Water, SS=Solids

2) EPA Approved Method - Where applicable EPA methods are listed. Compounds/programs not regulated by EPA will have methods appropriate to their regulatory oversight.

3) SW846 Method - Where one exists, the appropriate Solid Waste method will be listed

4) Preservative Key

$(NH_4)_2SO4$ = Ammonium Sulfate

AcAcid = Acetic Acid

CH_3Cl = Methylene Chloride

H_2SO_4 = Sulfuric Acid

HCl= Hydrochloric Acid

HNO_3 = Nitric Acid

MeOH = Methanol

$Na_2S_2O_3$ = Sodium Thiosulfate

$NaHSO_4$ = Sodium Bisulfate

NH_4Cl = Ammonium Chloride

TSP = Trisodium Phosphate

ZnAc = Zinc Acetate

5) Must be field filtered to achieve the extended holding time.

6) Must be received by lab within 7 days of sampling for solvent addition.

7) Must be received by lab within 4 days of sampling for solvent addition.

8) Must be received by lab within 48 hours of sampling for freezing.

9) Must be received by lab within 72 hours of sampling for solvent addition.

14.7 SAMPLE CONTAINER PACKING PROCEDURES

ESC routinely sends sample containers to customers. Standard operating procedure determines the containers needed for the requested analyses. A sample request form is completed to document what is needed, the destination, the date prepared and the initials of the preparer. Containers are prepared, with appropriate preservatives, labels, and custody seals, and organized for the customer's convenience in a cooler. The cooler also contains a temperature blank, chain of custody, a return address label, and applicable instructions. The cooler is bound with packaging tape (and a custody seal if requested) and shipped UPS.

15.0 SAMPLE DISPATCH

Samples collected during field investigations or in response to a hazardous materials incident are classified by the project manager, prior to shipping, as either environmental or hazardous material samples. The shipment of samples, designated as environmental samples, is not regulated by the U.S. Department of Transportation.

Samples collected from certain process streams, drums, bulk storage tanks, soil, sediment, or water samples from suspected areas of high contamination may need to be shipped as hazardous. These regulations are promulgated by the US-DOT and described in the Code of Federal Regulations (49 CFR 171 through 177). The guidance for complying with US-DOT regulations in shipping environmental laboratory samples is given in the "National Guidance Package for Compliance with Department of Transportation Regulations in the Shipment of Environmental Laboratory Samples."

15.1 SHIPMENT OF ENVIRONMENTAL SAMPLES

Shipping receipts are maintained at the ESC laboratory. The shipment of preserved sample containers or bottles of preservatives (i.e., NaOH pellets, HCl, etc.) which are designated as hazardous under the US-DOT, Hazardous Materials Table, 49 CFR 171.101, must be transported pursuant to the appropriate US-DOT regulations. Samples packaged for shipment by ESC shall be segregated by sample type, preservation requirements, and potential contaminant level. During events in which large numbers of samples are collected, samples are segregated by analyses required. If multiple sites are sampled, or if specific and separate areas of interest are identified, samples are further segregated for packaging prior to shipment.

Environmental samples are packed prior to shipment using the following procedures:

1. Select a cooler (clean and strong). Line the cooler with a large heavy-duty plastic bag.
2 Allow sufficient headspace (except VOC's or others with zero headspace requirements) to compensate for any pressure and temperature changes.
3. Be sure the lids on all bottles are tight.
4. Place all bottles in appropriately sized polyethylene bags.
5. Place VOC vials in foam material transport sleeves.
6. Place foam padding in the bottom of the cooler and then place the bottles in the cooler with sufficient space to allow for the addition of more foam between the bottles.
7. Put ice on top of and/or between the samples.
8. Place chain of custody in a clean dry bag and into the cooler. Close the cooler and securely tape the cooler shut. The chain of custody seals should be affixed to the top and sides of the cooler so that the cooler cannot be opened without breaking the seal.

9. The shipping containers must be marked "THIS END UP". The name and address of the shipper shall be placed on the outside of the container. Labels used in the shipment of hazardous materials are not permitted to be on the outside of the container used to transport environmental samples and shall not be used.

16.0 INVESTIGATION WASTE

16.1 GENERAL

Field surveys conducted by ESC may generate waste materials. Some of these waste materials may be hazardous requiring proper disposal in accordance with EPA regulations.

16.1.1 Types of Investigation Derived Wastes (IDW)

Materials which may be included in the IDW category are:

- Personnel protective equipment (PPE)
- Disposable sampling equipment (DE)
- Soil cuttings
- Groundwater obtained through well purging
- Spent cleaning and decontamination fluids
- Spent calibration standards

16.1.2 Managing Non-hazardous IDW

Disposal of non-hazardous IDW should be addressed prior to initiating work at a site. Facility personnel should be consulted and wastes handled in an appropriate manner as directed by the customer.

For development and purge water generated in the State of Florida, specific disposal requirements apply. The water is contained on-site in temporary storage until it is characterized. Appropriate disposal and/or treatment methods are then determined. Possible disposal options are:

- Direct discharge on-site to infiltrate the same or a more contaminated source
- Transportation to an off-site facility

In no case shall the water be discharged into any surface water unless permitted.

16.1.3 Management of Hazardous IDW

Disposal of hazardous or suspected hazardous IDW (as defined in 40 CFR 261.30-261.33 or displaying the characteristics of ignitability, corrosivity, reactivity, or TC toxicity) must be specified in the sampling plan. Hazardous IDW must be disposed in compliance with USEPA regulations. If appropriate, these wastes may be taken to a facility waste treatment system. These wastes may also be disposed of in the source area from which they originated if state regulations permit.

If on-site disposal is not feasible, appropriate analyses must be conducted to determine if the waste is hazardous. If so, they must be properly contained and labeled. They may be stored on the site for a maximum of 90 days before they must be manifested and shipped to a permitted treatment or disposal facility. Weak acids and bases may be neutralized in lieu of disposal as hazardous wastes. Neutralized wastewaters may be flushed into a sanitary sewer.

If possible, arrangements for proper containment, labeling, transportation, and disposal/treatment of IDW should be anticipated beforehand.

Investigation derived wastes should be kept to a minimum. Most of the routine studies conducted by ESC should not produce any IDW that are hazardous. Many of the above PPE and DE wastes can be deposited in municipal dumpsters if care is taken to keep them segregated from hazardous waste contaminated materials. Disposable equipment can often be cleaned to render it nonhazardous, as can some PPE, such as splash suits. The volume of spent solvent waste produced during equipment decontamination can be reduced or eliminated by applying only the minimum amount of solvent necessary.

MT. JULIET, TENNESSEE 37122
(615) 758-5858

NOTE: The QAM has been approved by the following people.

Johnny Davis, B.S., Inorganics Manager 615-773-7572

Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Manager, 615-773-9684

Chris Unterstein, B.S., Wet Lab Supervisor, 615-773-9775

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This manual discusses specific QA requirements for general analytical protocols to ensure analytical data generated from the Wet Chemistry Laboratory, or Wet Lab, are scientifically valid and are of acceptable quality. Any deviations from these requirements and any deviations that result in nonconforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and materials, and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in *Section 4.0 in the ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

Chris Unterstein, with a B.S. degree in Chemistry, is the Wet Chemistry Supervisor and is responsible for the overall production of this laboratory; including the management of the staff and scheduling. Mr. Unterstein has over 8 years of environmental laboratory experience. In his absence, Andrew Holt assumes responsibility for departmental decisions in Wet Chemistry laboratory.

Mr. Holt, with a B.S. in Plant and Soil Science, is proficient in wet chemistry analytical methods. Mr. Holt has 9 years of environmental laboratory experience.

5.2 TRAINING

5.2.1 All new analysts to the laboratory are trained by a Chemist or the Supervisor according to ESC protocol. ESC's training program is outlined in *SOP 030205 Technical Training and Personnel Qualifications.* Performance is documented using an initial demonstration of capability (IDOCs) and continuing demonstration of capability (CDOC). On-going acceptable capability in Wet Lab analyses is demonstrated by acceptable participation in multiple proficiency testing programs (PTs) and daily Quality Control sample analyses. Documentation of analyst training is maintained on file within the department.

6.0 FACILITIES AND LABORATORY SAFETY

6.1 FACILITIES

The main area of the Wet Chemistry laboratory has approximately 7,500 square feet of area, and contains LED lighting. The HVAC system is provided by a 15-ton Trane unit. The laboratory reagent water is generated through an Evoqua system. Waste disposal containers are located in the laboratory and Clean Harbors serves as ESC's waste disposal contractor. Waste handling is discussed in detail in Section 6.0 of the ESC Quality Assurance Manual. ESC's building information guides and site plan are shown in Appendix I.

6.2 LABORATORY SAFETY

- Laboratory access is limited when work is being performed.
- All procedures where chemicals are prepared or splashes may occur are conducted in laboratory exhaust hoods.
- ESC's laboratory safety guidelines are detailed in the *ESC Chemical Hygiene Plan.*

7.0 SAMPLING PROCEDURES

7.1 FIELD SAMPLING PROCEDURES, SAMPLE STORAGE, AND HANDLING

- Field Sampling procedure are described in Appendix III of this ESC Quality Assurance Manual. Sample information is recorded and kept on the ESC chain of custody and field logbooks.
- Matrices for Wet Lab environmental analyses include groundwater, wastewater, drinking water, soil, and sludge.
- Sample containers, preservation methods and holding times vary depending on analyses requested. Please see the determinative procedures for specific directions.

8.0 EQUIPMENT

8.1 EQUIPMENT LIST

LABORATORY EQUIPMENT LIST: MAJOR ITEMS – Wet Lab ***This table is subject to revision without notice***					
Item	***Manufacturer***	***Model***	***Instrument Name***	***Serial #***	***Location***

8.2 EQUIPMENT PREVENTIVE MAINTENANCE, EQUIPMENT CALIBRATION

INSTRUMENT	*P. M. DESCRIPTION*	*FREQUENCY*
Analytical Balances	•Check with Class "I" weights	Daily
Analytical Balances	•Service/Calibration (semi-annual contract maintenance and calibration check)	Tolerance - ±0.1%
Analytical Balances	•Service/Calibration (semiannual contract maintenance and calibration check)	Semi-annually
Refrigerators & Incubators	•Maintenance service	As needed - determined by daily temperature performance checks
Water Bath	•Check thermometer vs. NIST	Once/year
Water Bath	•Remove from service when not maintaining temperature and send off for repair or replace	As needed
Flash Point Tester	•Check thermometer vs. certified traceable	Once/year
Lachat Autoanalyzer	•Check pump tubes, change valve flares	At least 1/month
Pensky Martens	•Check fuel level, refill	As needed
Pensky Martens	•Clean cup thoroughly	Between each test and after use
TOC	•Maintain manufacturer's service contract	Renew each year
Turbidimeter - Hach 2100A	•Illumination lamp or window (alignment and/or replacement)	Erratic or poor response
pH Meters	•Reference junction & electrode replacement	As needed
pH Meters	•Probe stored in KCl	At all times when not in use
pH Meters	•Other	As described in the manufacturer's O & M manual
Ion Chromatograph	•Replace guard and analytical columns	As needed
Ion Chromatograph	•Replace the end-line filter (P/N 045987)	As needed
Ion Chromatograph	• Replace the pump piston rinse seals and piston seals	Every 6 months or as needed
Ion Chromatograph	•Replace the sampling tip and the tubing between the tip and the injection valve.	As needed
Ion Chromatograph	•Replace lines throughout the instrument	As needed
Ion Chromatograph	•Perform Preventive Maintenance using PM kit (P/N 057954)	Annual

8.3 STANDARDS AND REAGENTS

Table 8.3A lists standard sources, receipt, and preparation information. Table 8.3B is designed to provide general calibration range information. These ranges may change depending on regulatory requirements, procedural changes, or project needs. Table 8.3C indicates the procedures and frequency for the standardization of laboratory solutions used for titrations.

Table 8.3A: Standard sources, description and calibration information.
This table is subject to revision without notice

Instrument Group	Standard Source	How Received*	Source/ Storage	Preparation from Source	Lab Stock Storage	Preparation Frequency
Alkalinity, Acidity	Lab preparation	Acidity-matrix standard grade KHP	Room temp.	0.0500N	4°± 2°C	6 months
Ammonia-Nitrogen and Total Kjeldahl Nitrogen Primary Stock	Lab preparation	ACS grade NH4Cl	Room temp.	1,000ppm stock standard	Room temp.	Annually or sooner if check samples reveal a problem
Ammonia-Nitrogen and Total Kjeldahl Nitrogen	Lab preparation	Primary Stock	Room temp.	Working Standards	Not stored	Prepared fresh as needed
COD	Lab preparation	Acid grade KHP	Dessicator	Stock solution (10,000ppm)	4°± 2°C	When absorbance of curve changes or check samples are out of control
Cyanide (Autoanalyzer)	Lab preparation	KCN	Reagent shelf	Stock solution (1,000ppm)	4°± 2°C	6 months. Working dilutions prepared daily as needed
Fluoride Primary Stock	Inorganic Standard. NSI Lab preparation	ACS grade KF	Room temp.	100ppm stock solution	Room temp.	1 year or as needed when reference standard fails
Fluoride	Lab preparation	Primary Stock	Room temp.	Dilute standards	Not stored	Prepared fresh daily
Hardness	Lab preparation	Chelometric Std. $CaCO_3$	Room temp.	1mg/mL as CaCO3	Room temp.	Annually or sooner if check samples reveal a problem
IC (Chloride, Nitrate, Nitrite, Bromide, Sulfate, Fluoride)	Commercial source	Varies	4°± 2°C	Working Standards as needed per analyte	4°± 2°C	6 months or sooner if check samples reveal a problem
IC (Chloride, Nitrate, Nitrite, Bromide, Sulfate, Fluoride)	Inorganic Standards	Varies	4°± 2°C	Working Standards as needed per analyte	4°± 2°C	Midpoint standard prepared weekly or sooner if necessary
IC (Chloride, Nitrate, Nitrite, Bromide, Sulfate, Fluoride)	NSI (2nd source)	Varies	4°± 2°C	Working Standards as needed per analyte	4°± 2°C	Prepared weekly or sooner if necessary
MBAS	Lab preparation	LAS Reference Material	4°± 2°C	1,000mg/mL working standards	4°± 2°C Wet Stored	6 months or when check standards are out of control. Prepared fresh.

Table 8.3A: Standard sources, description and calibration information.
This table is subject to revision without notice

Instrument Group	Standard Source	How Received*	Source/ Storage	Preparation from Source	Lab Stock Storage	Preparation Frequency
Nitrite-Nitrate (autoanalyzer)	Lab preparation	ACS grade KNO3	Reagent shelf	Stock solution (1000ppm)	4°± 2°C	When absorbance of curve changes or check samples are out of control
pH Meter	Commercial Source	pH 4.0 Buffer	Room temp.	No prep required	NA	Annual/Expiration Date
pH Meter	Commercial Source	pH 7.0 Buffer	Room temp.	No prep required	NA	Annual/Expiration Date
pH Meter	Commercial Source	pH 10.0 Buffer	Room temp.	No prep required	NA	Annual/Expiration Date
Phenols (autoanalyzer)	Lab preparation	ACS Certified Phenol	Reagent shelf	Stock solution (1000ppm)	4°± 2°C	Every month. Working solutions prepared daily as needed.
Phosphate	(H_2O) - Prepared in Lab Total Phos. (soils) RICCA, ERA	KH2PO4	Reagent shelf	Stock solution (50ppm as P)	Room temp.	When absorbance of curve changes or check samples are out of control. Working solutions prepared daily as needed.
Specific Conductivity Meter	NSI-Primary	ACS Certified KCl	Room temp.	Working Standard (0.01M)	Room temp.	As needed
Specific Conductivity Meter	ERA-2nd Source	ACS Certified KCl	Room temp.	Working Standard (0.01M)	Room temp.	As needed
Sulfate	Inorganic Standards, NSF Prepared in Lab	Anhydrous Na2SO4	Reagent shelf	Stock solution (100ppm)	Room temp.	When visible microbiological growth or check samples are out of control
Turbidimeter	Commercial Source Hach	Hach	Room temp.	No prep required	NA	Checked daily against Formazin Standards
pH Meter	Commercial Source	pH 1.0 Buffer	Room temp.	No prep required	NA	Annual/Expiration Date
pH Meter	Commercial Source	pH 13.0 Buffer	Room temp.	No prep required	NA	Annual/Expiration

Table 8.3B: WORKING STANDARD CALIBRATION

Analysis	Calibration Standard
Alkalinity, Acidity- Titrimetric	Primary standard grade Na_2CO_3.
Alkalinity - Methyl orange Autoanalyzer	Primary standard grade Na_2CO_3: 0, 10, 25, 50,100, 250, 375, 500 mg/L
Bromide IC	Range –1.0, 5.0, 10, 50, 100, mg/L
Chloride IC	Range –1.0, 5.0, 10, 50, 100, mg/L1
Conductivity	Standard KCl solution: 1413
Cyanides	Blank, 0.0025 – 0.40ppm. Distill one standard as check with each batch.
COD	KHP (Potassium hydrogen phthalate) standards 20 – 1000 mg/L
Chromium – Hexavalent (Colorimetric)	Blank, 0.0101, 0.0202, 0.0505, 0.1010, 0.2525, 0.5050, 1.010 mg/L
Chromium – Hexavalent (IC)	Blank, 0.5, 1.0, 2.0, 10, 20, 50, 100 ug/L
Fluoride – IC	Range –0.10, 0.50, 1.0, 5.0, 10.0, mg/L
Hardness	$CaCO_3$, chelometric standard.
Hardness (Colorimetric)	Range – 30, 50, 60, 100, 150, 200, 300 mg/L
MBAS	LAS reference material: 0.0, 0.1, 0. 5, 1.0, 1.5, 2.0 mg/L
Nitrogen-Ammonia – Autoanalyzer	Calibration standards: 0, 0.10, 0.50, 1.0, 2.0, 5.0, 10, 20 mg/L
Nitrogen-Nitrate, Nitrite – Autoanalyzer	Blank, 0.1, 0.50, 1.00 5.0, 7.0, 10.0 mg/L

Table 8.3B: WORKING STANDARD CALIBRATION	
Analysis	**Calibration Standard**
Nitrogen-Nitrate – IC	Range –0.10, 0.50, 1.0, 5.0, 10.0, mg/L
Nitrogen-Nitrite – IC	Range –0.10, 0.50, 1.0, 5.0, 10.0, mg/L
Orthophosphate, Total Phosphate	Blank, 0.025, 0.10, 0.25, 0.50, 0.75, 1.0mg/L diluted from standard KH_2PO_4
Perchlorate	Range – 0.5, 1.0, 3.0, 5.0, 10, 20, 25 mg/L
pH	Buffers1.0, 4.0, 7.0, 10, 13
Phosphate, Total	Range – 0.0, 0.1, 0.5, 1.0, 2.5, 5.0 mg/L
Phosphate – IC	Range –0.10, 0.50, 1.0, 5.0, 10.0, 15.0, 20.0 mg/L
Phenols (chloroform ext.)	Blank 0.04, 0.05, 0.10, 0.50, 1.0, 2.0mg/L Distill one standard with each batch
Solids	Gravimetric balance calibrated charts, checked with Class "I" weights in range of sample tare weights.
Sulfate – IC	Range –1.0, 5.0, 10, 50, 100, 150, 200 mg/L
Sulfide (Colormetric)	Range –0.0, 0.05, 0.1, 0.5, 1.0, 1.5, 2.0 mg/L
Sulfite	Titration
TKN	Range – 0.0, 0.1, 0.5, 1.0, 2.5, 5.0, 10, 20 mg/L
Turbidity	Range –0, 20, 200, 1000, 4000NTU
TOC	Range –0, 1.0, 2.5, 5.0, 7.5, 10, 20, 50, 75, 100 mg/L
TOX	Cell checks at 1, 20, 40 ug

Table 8.3C: STANDARDIZATION OF TITRATION SOLUTIONS		
Solution	**Primary Standard**	**Frequency**
0.0200 N NaOH	0.050 N KHP	Daily as needed
0.0200 N H_2SO_4	Freshly prepared and standardized NaOH (from KHP standard)	6 months or with each new batch
0.0141 N Hg $(NO_3)_2$	Standard NaCl solution 500 ug Cl/ml	Daily as used
0.0100 M EDTA	Standard $CaCO_3$ solution 1 mg $CaCO_3$/liter	Daily as used

8.4 INSTRUMENT CALIBRATION

Total Organic Carbon Analyzer (TOC) in GW/WW – SOP Number 340356A

The TOC standard curve is prepared using a minimum of five standards. Linear regression is used for quantitation with the correlation coefficient being at least 0.995. The calibration range is 1.0mg/L to 100mg/L. During the analytical sequence, the stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of continuing calibration verification (CCV) standards. The CCV must recover within 10% of the expected value for each analyte.
A laboratory control standard (LCS) is prepared from a source that is independent from the calibration standards and used to verify that the calibration curve is functioning properly and that the analytical system performs acceptably within a clean matrix. The LCS must recover within ±15% of the expected concentration.

Total Organic Carbon Analyzer (TOC) in DW – SOP Number 340356B

The TOC standard curve is prepared using a minimum of five standards. Linear regression is used for quantitation with the correlation coefficient being at least 0.995. The calibration range is 0.5mg/L to 5.0mg/L. During the analytical sequence, the

stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of continuing calibration verification (CCV) standards. The CCV must recover within 10% of the expected value for each analyte.

A laboratory control standard (LCS) is prepared from a source that is independent from the calibration standards and used to verify that the calibration curve is functioning properly and that the analytical system performs acceptably within a clean matrix. The LCS must recover within ±15% of the expected concentration. Dissolved organic carbon can be analyzed using this procedure by filtering the unpreserved sample using a 0.45um filter, then performing the analysis on the filtrate using the same process as the TOC procedure.

Total Organic Carbon Analyzer (TOC) in Soil (Walkley Black) – SOP Number 340368

The Walkley Black standard curve is prepared using a minimum of six standards. Linear regression is used for quantitation with the correlation coefficient being at least 0.995. The calibration range is 0.1mg/L to 5.0mg/L. During the analytical sequence, the stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of continuing calibration verification (CCV) standards. The CCV must recover within 10% of the expected value for each analyte.

A laboratory control standard (LCS) is prepared from a source that is independent from the calibration standards and used to verify that the calibration curve is functioning properly and that the analytical system performs acceptably within a clean matrix. The LCS must recover within ±50% of the expected concentration. This method is used to determine Fractional Organic Carbon (FOC) as required by the state of Indiana.

Total Organic Halogen Analyzer (TOX) – SOP Number 340360

The cell performance of the TOX analyzer is verified at the beginning of each analytical sequence in the low, mid and high ranges. The verifications must recover within 3% of the expected target value. The instrument performs a linear regression using the values determined with the required correlation coefficient being at least 0.995. During the analytical sequence, the stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of continuing calibration verification (CCV) standards. The CCV must recover within 10% of the expected value for each analyte.
A laboratory control standard (LCS) is prepared from a source that is independent from the calibration standards and used to verify that the calibration curve is functioning properly and that the analytical system performs acceptably within a clean matrix. The LCS must recover within ±15% of the expected concentration.

Anions by Ion Chromatography – SOP 340319

Least Squares Linear Regression is the primary method of quantitation; where a minimum of five standards is used and the correlation coefficient must be at least 0.995 for each analyte of interest. The calibration range varies depending upon the analyte(s) to be determined. During the analytical sequence, the stability of the initial calibration is

verified, following every 10th sample and at the end of the sequence, by the analysis of continuing calibration verification (CCV) standards. The CCV must recover within 10% of the expected value for each analyte, except during the analysis of groundwater and soil using EPA Method 9056 that must recover within 5%.

A laboratory control standard (LCS) is prepared from a source that is independent from the calibration standards and used to verify that the calibration curve is functioning properly and that the analytical system performs acceptably within a clean matrix. The LCS must recover within ±10% for water samples and ±15% of the expected concentration for soil samples.

Hexavalent Chromium by Ion Chromatography – SOP 340372 & 340372A

These procedures are utilized to analyze for hexavalent chromium (Cr6+) by ion chromatography using a variety of published methods and the relevant SOP addresses both the common and method specific requirements for each published method. The Cr^{6+} standard curve is prepared using a minimum of five or six standards at various levels depending on the expected concentration of the field samples, the analytical method requested and the matrix. Linear regression is used for quantitation with the correlation coefficient being at least 0.995. During the analytical sequence, the stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of continuing calibration verification (CCV) standards. The recovery of the CCV must be within 10% of the expected value for the analyte using SM 3500Cr C and EPA Method 7199. The CCV for EPA 218.6 must recover within ±5% and the mid-level CCV for EPA 218.7 must recover within ±15%.

A laboratory control standard (LCS) is prepared from a source that is independent from the calibration standards and used to verify that the calibration curve is functioning properly and that the analytical system performs acceptably within a clean matrix. The LCS must recover within ±10% of the expected concentration.

Aqueous and solid Hexavalent Chromium samples can also be analyzed by colorimetry using EPA 7196A and SM 3500Cr B – SOP 340318B & 350318C. Specific requirements for those methods are contained within the specified SOPs. Soil samples are prepared for both the IC and colorimetric method using alkaline digestion found in EPA 3060A and discussed in both soil SOPs 350318C and 340372A.

Gravimetric Analyses – Various SOPs

Gravimetric analyses are performed using several different published methods, including TDS, TSS, TVDS, TS, TVS, VSS, Settleable Solids, Total Particulates, and Respirable Particulates. Calibration for these methods require use of Class I weights and a properly performing and verified balance. Where possible, laboratory control standards are analyzed in conjunction with field sample analysis to verify that the analytical process is performing accurately. Sample duplicate analyses also provide verification that the analytical process is performing as required.

Auto-Analyzer (Lachat) – Various SOPs

The Autoanalyzer calibration curve is prepared using a minimum of five standards. For most analyses, linear regression is used for quantitation with the correlation coefficient being at least 0.995. The calibration range varies depending upon the analyte to be determined. During the analytical sequence, the stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of continuing calibration verification (CCV) standards. Routinely, the CCV must recover within 10% of the expected value for each analyte, but is dependent on the analyte of concern, the matrix of the sample and the determinative method.

A laboratory control standard (LCS) is prepared from a source that is independent from the calibration standards and used to verify that the calibration curve is functioning properly and that the analytical system performs acceptably within a clean matrix. The LCS must recover within ±15% of the expected value, except for cyanide, ammonia, total phosphorus, NO2NO3 and TKN where ±10% applies.

Perchlorate in Drinking Water – ESC SOP 340370

The Ion Chromatograph calibration curve is prepared using a minimum of five standards. The instrument performs a linear regression using the values determined with the required correlation coefficient being at least 0.995. During the analytical sequence, the stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of continuing calibration verification (CCV) standards. The CCV must recover within 15% of the expected value for each analyte.

A laboratory control standard (LCS) is prepared from a source that is independent from the calibration standards and used to verify that the calibration curve is functioning properly and that the analytical system performs acceptably within a clean matrix. The LCS must recover within ±10% of the expected concentration.

8.5 ACCEPTANCE/REJECTION OF CALIBRATION

All new standard curves are immediately checked with a laboratory control standard from a separate source than that used for calibration. All curves are visually reviewed to ensure that acceptable correlation represents linearity. Calibration curves may be rejected for nonlinearity, abnormal sensitivity, or poor response of the laboratory control standard. Specific criteria for each instrument are outlined in Table 8.5.

Continuing calibration is performed following every tenth sample. If a check standard does not perform within established criteria then the instrument is evaluated to determine the problem. Once the problem is corrected, all samples between the last “in control” sample and the out of control check are re-analyzed.

TABLE 8.5: INSTRUMENT CALIBRATION

Instrument (Analysis)	Calibration Type	Number of Standards	Type of Curve	Acceptance/Rejection Criteria	Frequency
pH Meter*	Initial	5 (buffers) 1 reference buffer	Log.	Third pH of a different value buffer must read within 0.05 units of true value	Daily as used
	Continuing	1 buffer (may be any certified buffer)		Buffer solution must read within 0.05 units of true value	Every 10th sample; Field**
Conductivity Meter*	Initial	1	1 point	Calculation of cell constant between 0.95 - 1.05	Daily as used
	Continuing	1		Must be within 5% of true value	Every 10th sample; Field**
Turbidimeter *	Initial	5	Linear	Formazin-confirmed Gelex standards in appropriate range. Check with second standard must be within 5%	Daily as used
	Continuing	1 reference of different value, 1 (high-level)		Must be within 5% of true value	Every 10th sample; Field**
UV/VIS Spec.	Initial	At least 5 standards calibration standards	Linear	Calibration Curve must have a correlation of 0.995 or better	Daily as used
		2 laboratory control standard		Must be within $\pm$ 15% of the calibration curve.	Daily as used
	Continuing	1 mid-level reference std.		Must be within 90 – 110%	Every 10th sample
Total Organic Halogen Analyzer	Initial	3 calibration standards	Linear	Calibration Curve must have a correlation of 0.995 or better	Daily as used
		1 laboratory control standard		Laboratory control standard must agree within $\pm$ 15% of calibration curve	Daily as used
	Continuing	1 mid-level reference std.		Must be within 90 – 110%	Every 10th sample
Total Organic Carbon Analyzer	Initial	5 calibration standards	Linear	Calibration Curve must have a correlation of 0.995 or better	Every 6 months or as needed
		2 laboratory control standard		Laboratory control standard must agree within $\pm$ 15% of calibration curve	Daily as used
	Continuing	1 mid-level reference std.		Must be within 90 – 110%	Every 10th sample

Note: ESC defines a "laboratory control standard" as a standard of a different concentration and source than those stock standards used for calibration.
*This equipment is also calibrated and used in the field.
**Field equipment must be checked every 4 hours and at the end of the day.

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

Reagent grade water is obtained from either a Barnstead NANOpure Diamond system or the Millipore Milli-Q Academic A-10 system.

9.2 GLASSWARE WASHING AND STERILIZATION PROCEDURES

General

Routine laboratory glassware is washed in a non-phosphate detergent and warm tap water. Before washing all labeling and large deposits of grease are removed with acetone. Glassware is then rinsed with: tap water, "No Chromix" solution, tap water, and deionized (DI) water. Glassware is stored in designated drawers or on shelves, inverted when possible. All glassware is rinsed with the required solvent, prior to use. DI water is then used as a precaution against airborne contamination

Phosphate Glassware

Glassware involved in phosphate analysis is marked and segregated. All labels and markings are removed from the glassware prior to washing. The glassware is then washed using hot water and a non-phosphorus detergent. It is then rinsed thoroughly in hot water followed by a rinse in DI water. It is rinsed in 1:1 HCl followed by a final rinse of DI water. If the phosphate glassware has not been used recently, it is the responsibility of the analyst to rinse the glassware with warm 1+9 hydrochloric acid prior to use.

Nutrients and Minerals Glassware

All labels and markings are removed from the glassware prior to washing. The glassware is then washed using hot water and detergent. It is then rinsed thoroughly in hot water followed by a rinse in DI water. It is rinsed in 1:1 HCl followed by a final rinse of DI water.

Immediately prior to use, the ammonia glassware is rinsed in DI water. Routine blanks are run on ammonia glassware to ensure that the detergent is contaminant free.

Non-Metals (CN, COD) Glassware

All labels and markings are removed prior to washing. The glassware is soaked in hot soapy water followed by a thorough rinse with hot tap water. A final rinse of DI water is then performed.

10.0 ANALYTICAL PROCEDURES

10.1 A list of laboratory SOPs associated with the Wet Lab can be found in the following table:

TABLE 10.1: WET LAB DEPARTMENT SOPs

This table is subject to revision without notice

SOP #	Title
340300	Acidity (SM 2310B)
340301	Alkalinity (Titrimetric)
340302	Alkalinity - Lachat
340305	Chlorine, Total Residual DPD- 330.5 SM4500-CL-G
340307	Cyanide- All Forms (Colorimetric Automated UV) - Lachat
340307	Cyanide- OI Method
340309	Chemical Oxygen Demand
340310	Color by Visual Comparison (SM2120B, EPA 110.2)
340313	Density (Specific Gravity)
340317	Total Hardness (mg/l as CaCO3) - (Titrimetric)
340317	Total Hardness by Lachat Method 130.1
340318	Hexavalent Chromium (Colorimetric) Soil 3060A/7196A
340318	Hexavalent Chromium (Colorimetric) Water 7196A
340319	Ion Chromatography - Anions by 300.0, SM 4110B and 9056/9056A
340319	Ion Chromatography - Anions OH VAP
340325	MBAS (Methylene Blue Active Substances)
340327	Ammonia, Phenolate (OI)
340327	Ammonia, Phenolate (Lachat)
340328	Organic Nitrogen
340331	Threshold Odor Test
340333	Nitrate/Nitrite (Lachat Autoanalyzer)
340333	Nitrate/Nitrite (OI Autoanalyzer)
340334	Paint Filter Test
340335	pH/Corrosivity
340336	Phenol - 4AAP (Lachat Autoanalyzer)
340338	Total Phos GW/WW (365.4) Colorimetric
340338	Total Phos.(361.2, 4500P-B/F) Colorimetric
340338	Orthophosphate (365.2,4500P-E) Colorimetric
340339	Reactivity
340340	Reactive Cyanide/Sulfide Distillation
340342	Specific Conductance (120.1, 2510B)
340344	Sulfide (Colorimetric Methylene Blue) (376.2)
340344	Sulfide Acid-soluble,and acid-insoluble Method 9034
340345	Sulfite
340346	Settleable Solids
340347	Total Dissolved Solids
340348	Total Suspended Solids (Non-Filterable Residue)
340349	Total Solids/Percent Moisture

SOP #	Title
340350	Total Volatile Solids
340352	Total Kjeldahl Nitrogen
340354	Turbidity
340356	Total Organic Carbon In Soils (loss of weight on ignit.
340356	TOC for Drinking Water only
340356	Total Organic Carbon (TOC) and Total Inorganic Carbon (TIC) using Shimadzu 5000A for GW and WW
340357	Ignitability

340366	Oxidation Reduction Potential
340367	Extractable Organic Halides
340368	TOC in Soil (Walkley-Black)
340369	Carbon Dioxide by Calculation
340370	Perchlorate in DW
340371	Chlorine in Oil (ASTM D808-00)
340372	Hexavalent Chromium in Soil by IC (3060A/7199)
340372	Hexavalent Chromium in Water by IC (218.7/SM 3500Cr)
340373	Organic Matter (FOM) and Fractional Organic Carbon (FOC)
340374	Total Volatile Dissolved Solids (TVDS)
340375	Hexavalent Chromium in Air by IC
340376	Total Organic Halides in Oil (EPA 9076)
340377	Manual Nitrocellulose Analysis
340378	Volatile Suspended Solids
340379	Guanidine Nitrate by IC
340381	Ash in Petroleum Products (ASTM D482-07)

11.0 QUALITY CONTROL CHECKS

NOTE: For specific guidance on each determinative method, including required quality control and specific state requirements/modifications, refer to the relevant laboratory standard operating procedure(s).

11.1 ESC participates in proficiency testing (PTs) in support of various laboratory accreditations/recognitions. Environmental samples are purchased from Phenova. The WS, WP and solid matrix studies are completed every 6 months.

11.2 Initial Demonstrations of Capability (IDOCs) are performed during new analyst training and/or prior to acceptance and use of any new method/instrumentation. Continuing Demonstration of Capability (CDOCs) must be updated at least annually. The associated data is filed within the department and available for review.

11.3 Where appropriate, Matrix Spike and Matrix Spike Duplicates are performed on each batch of samples analyzed, depending on analytical method requested.

11.4 A Laboratory Control Sample (LCS) is analyzed once per batch of samples. Where appropriate, an LCS Duplicate may also be analyzed.

11.5 Where appropriate, a method preparation blank is performed per batch of samples processed. If one-half the reporting limit [RL] is exceeded, the laboratory shall evaluate whether reprocessing of the samples is necessary, based on the following criteria:

- The blank contamination exceeds a concentration greater than 1/10 of the measured concentration of any sample in the associated preparation batch or
- The blank contamination is greater than 1/10 of the specified regulatory limit.

The concentrations of common laboratory contaminants shall not exceed the reporting limit. Any samples associated with a blank that fail these criteria shall be reprocessed in a subsequent preparation batch, except when the sample analysis resulted in non-detected results for the failing analytes.

12.0 DATA REDUCTION, VALIDATION AND REPORTING

12.1 DATA REDUCTION

The analyst performs the data calculation functions and is responsible for the initial examination of the finished data. Data reduction steps applied to the raw data are outlined in ESC SOP #030201, *Data Handling and Reporting.* A secondary review of the data package using the ESC SOP #030227, *Data Review*. The reviewer verifies that the analysis has been performed as required and meets method criteria, all associate data is present and complete, and also ensures that any additional documentation is completed as required (i.e. Ohio VAP checklists, required qualifiers on test reports, etc.)

TABLE 12.1: Data Reduction Formulas

PARAMETER	FORMULA
Acidity, Alkalinity	$\frac{\text{mL titrant x normality titrant x 50,000}}{\text{mL sample}}$
COD, Sulfate	Concentration from curve x dilution factor
Orthophosphate, Hexavalent Chromium	Calculated by computer software as provided by HACH Corp.
Nitrogen-Nitrate, Phenols,Nitrogen-Ammonia, Total Phosphate, Nitrogen-Total Kjeldahl**	Calculated by computer software as provided by Lachat Corp.
Anions, Hexavalent Chromium	Calculated by computer software as provided by Dionex
Conductivity*, pH, Turbidity,	Directly read from instrument
Cyanide, Total and Amenable	$\frac{\text{µg from standard curve x mL total volume absorbing solution}}{\text{mL volume sample x mL volume of absorbing solution colored}}$ *Calculated by software as provided by Lachat Corp.*
Solids, Total and Total Dissolved	$\frac{\text{((mg wt of dried residue + dish) - mg wt of dish) x 1000}}{\text{mL sample}}$

PARAMETER	FORMULA
Solids, Total Suspended	((mg wt of dried residue + filter) - mg wt of filter) x 1000 / mL sample

12.2 VALIDATION

The validation process consists of data generation, reduction review, and reporting results. Once data reduction is complete, validation is conducted by verification that the QC samples are within acceptable QC limits and that all documentation is complete, including the analytical report and associated QC. See Table 12.3 by method for current QC targets, controls and current reporting limits.

12.3 REPORTING

Reporting procedures are documented in *SOP 030201 Data Handling and Reporting.*

Inorganic Control Limits: Inorganic QC targets are statutory. The laboratory calculated limits verify the validity of the regulatory limits. The Wet Lab QC targets for all inorganic analyses are within the range of $\pm$ 5 to 15% for accuracy, depending on determinative method requirements, and, where applicable, $\leq$20 RPD for precision, unless laboratory-generated data indicate that tighter control limits can be routinely maintained. When using a certified reference material for QC sample analysis, the acceptance limits used in the laboratory will conform to the provider's certified ranges for accuracy and precision.

Table 12.3: QC Targets for Wet Lab Accuracy (LCS), Precision and RLs
This table is subject to revision without notice

Analyte	Analysis Method	Matrix	Accuracy Range (%)	Precision (RPD)	RL (ppm)
Acidity	SM 2310B	w	85 - 115	<20	10
Acidity	SM 2310B	s	85 - 115	<20	10

13.0 CORRECTIVE ACTIONS

13.1 In the event that a nonconformance occurs in conjunction with the analytical batch, a corrective action response (CAR) form must be completed. The cause of the event is stated on the form and the measures taken to correct the nonconformance clearly defined. The effectiveness of the corrective action must be assessed and noted. The CARs are kept on file by the Regulatory Affairs Department. Corrective action procedures are documented in SOP #030208, *Corrective and Preventive Action*

13.2 Required Corrective Action

Control limits have been established for each type of analysis. When these control limits are exceeded, corrective action must be taken. Calculated sample spike control limits are also used.

All samples and procedures are governed by ESC's quality assurance program. General corrective actions are as follows; however additional and more specific direction is provided in the specific determinative procedure. For more information, see the appropriate determinative SOP.

13.2.1 Laboratory QC Criteria and Appropriate Corrective Actions

If the analytical method contains acceptance/rejection criteria and it is more stringent than those controls generated by the laboratory, the method criteria takes precedence.

13.2.2 Calibration Verification Criteria Are Not Met: Inorganic Analysis

Rejection Criteria - See Table 8.5.

Corrective Action - If a standard curve linearity is not acceptable and/or the absorbance for specific standard(s) is not analogous to historic data, the instrument settings, etc. are examined to ensure that nothing has been altered, clogged, etc. Check the standard curve for linearity and re-analyze the standards once. If the failure persists, the working standards are made fresh, intermediate dilutions are re-checked and the instrument is re-calibrated. If a problem persists, the Supervisor or Regulatory Affairs Department is notified for further action.

If the initial reference check sample is out of control, the instrument is re-calibrated and the check sample is re-analyzed. If the problem continues the check sample is re-prepared. If the problem still exists then the standards and reagent blank are re-prepared. If the problem persists, the Supervisor or Regulatory Affairs Department is notified for further action.

13.2.3 Out Of Control Blanks: Applies to Method, Trip, Rinsate & Instrument Blanks

Rejection Criteria - Blank reading is more than twice the background absorbance or more than MDL.

Corrective Action - Blanks are re-analyzed and the response is assessed. Standard curves and samples are evaluated for any obvious contamination that may be isolated or uniform throughout the run. If necessary, reagents are re-prepared. Field sample analyses are not started until the problem is identified and solved. If samples have already been partially prepared or analyzed, the Supervisor or Regulatory Affairs Department is consulted to determine if data needs to be rejected or if samples need to be re-prepped.

13.2.4 Out Of Control Laboratory Control Standards (LCS)

Rejection Criteria - If the performance of associated laboratory control sample(s) is outside of control limits either method defined or calculated as the mean of at least 20 data points ± 3 times the standard deviation of those points. (Listed in Section 12).

Corrective Action - Instrument settings are checked, LCS standard is re-analyzed. If the LCS is still out of control, re-calibration is performed, and samples affected since the last "in control" reference standard are re-analyzed. The Supervisor or Regulatory Affairs Department is consulted for further action.

13.2.5 Out Of Control Matrix Spike Samples

Rejection Criteria - If either the MS or MSD sample is outside the established control limits.

Corrective Action - Any compound that is outside of these limits is considered to be 'out of control' and must be qualified appropriately. Batch acceptance, however, is based on method blank and LCS performance, not on MS/MSD recoveries. Specific methods, customers, and programs may require further corrective action in some cases.

13.2.6 Out Of Control Duplicate Samples

Rejection Criteria - Lab-generated or method required maximum RPD limit (as listed under precision in Section 12)

Corrective Action - Instrument and samples are checked to see if precision variance is likely (i.e., high suspended solids content, high viscosity, etc.). They are re-analyzed in duplicate and samples just preceding and following the duplicated sample are re-analyzed. If problem still exists, the Supervisor or Regulatory Affairs Department is notified to review the analytical techniques.

13.2.7 Out Of Control Calibration Standards: ICV, CCV, SSCV

Rejection Criteria - If the performance is outside of method requirements.

Corrective Action - Instrument settings are checked, calibration verification standard is reanalyzed. If the standard is still out of control, re-calibration is performed, and samples affected since the last "in control" reference standard are re-analyzed. The Supervisor or Regulatory Affairs Department is consulted for further action.

14.0 RECORD KEEPING

Record keeping is outlined in SOP #030230, *Standards Logger, SOP #030227, Data Review* and SOP #030201, *Data Handling and Reporting*

All calibration data and graphs generated for wet chemistry are kept digitally with the following information: date prepared, calibration concentrations, correlation, and analyst initials. The analyst reviews the calibration and evaluates it against acceptance criteria before placing it in the calibration notebook. Data on initial and continuing reference standards, as well as matrix spikes and duplicates, are entered in the QC box generated on each analysis page. If a test allows the use of a previously established calibration curve then the calibration check standard is reviewed against acceptance criteria and if acceptable, analysis can proceed. In this situation the calibration date is referenced so that the curve can be easily reviewed, if necessary.

15.0 QUALITY AUDITS

System and data quality audits are outlined in the ESC Quality Assurance Manual *Version 13*.0 and *SOP #010104, Internal Audits*.

16.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix IV)	General – Replaced the term “client” with the term “customer” Section 6.1 – Updated to reflect current facilities Section 7.1 – Removed IH test Table 8.1 – Updated Equipment List Section 12.3 – Removed IH QC Table Table 12.3 – Updated RLs

Steve Miller, B.S., Quality Assurance Manager, 615-773-9684

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This appendix discusses specific QA requirements for general analytical protocols to ensure that data generated from the Metals Laboratory is scientifically valid and is of acceptable quality. Any deviations from these requirements and any deviations that result in nonconforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in *Section 4.0 in the ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

John Davis, with a B.S. degree in Biology, is the Department Supervisor and is responsible for the overall production of these laboratories; including the management of the staff and scheduling. Mr. Davis has 13 years of environmental laboratory experience. In his absence, Rodney Street assumes responsibility for departmental decisions in the Metals Department.

Mr. Rodney Street, with a B.S. degree in Medical Technology, is the Technical Specialist for the Metals Lab. He is proficient in inorganic analytical methods and has 34 years of environmental laboratory experience.

5.2 TRAINING

Senior Analysts or the Supervisor trains all new analysts to the laboratory according to ESC protocol. ESC's training program is outlined in *SOP 030205 Technical Training and Personnel Qualifications.* Performance is documented using an initial demonstration of capability (IDOCs) and continuing demonstration of capability (CDOC). On-going acceptable capability in metals analysis and preparation is also demonstrated by acceptable participation in multiple proficiency testing programs (PTs) and using daily Quality Control sample analyses. Documentation of analyst training is maintained on file within the department.

6.0 FACILITIES AND LABORATORY SAFETY

6.1 FACILITIES

The main area of the analysis laboratory has approximately1200 square feet with roughly 90 square feet of bench area. The main area of the metals prep laboratory has approximately 1200 square feet with 232 square feet of bench area. The main area of the Mercury/TCLP laboratory has approximately 1272 square feet with 136 square feet of bench area. The lighting standard in all three labs is fluorescence. The air system is a 15-ton make-up unit plus 15-ton HVAC with electric heat. The laboratory reagent water is provided through the US Filter deionizer system. Waste disposal containers are located in the laboratory and Clean Harbors serves as ESC's waste disposal company. ESC's building information guides and site plan are shown in Appendix I.

6.2 LABORATORY SAFETY

- Laboratory access is limited when work is being performed.
- All procedures where chemicals are prepared or splashes may occur are conducted in laboratory exhaust hoods.
- ESC's laboratory safety guidelines are detailed in *the ESC Chemical Hygiene Plan.*

7.0 SAMPLING PROCEDURES

7.1 FIELD SAMPLING PROCEDURES, SAMPLE STORAGE, AND HANDLING

- Field Sampling procedure is described in Appendix III of this ESC Quality Assurance Manual. Sample information is recorded and kept on the ESC chain of custody and field logbooks.
- Matrices for metals analysis are as follows: groundwater, wastewater, drinking water, soil, sludge, paint chips, wipes, filters, and leachates.
- Sample containers, preservation methods and holding times:
  - Glass containers are acceptable for all elements except Boron and Silicon. Plastic must be used for Boron and Silicon.
  - Water samples that are analyzed for dissolved metals must be filtered using a 0.45µm pore membrane. Water samples for total metals are not filtered. All water samples are acidified with 1+1 nitric acid to a pH<2. Filtered water samples (dissolved metals) are preserved immediately after filtration. All other water samples are preserved immediately after sampling. Water samples are not refrigerated prior to analysis.
  - Paint chips, dust wipes and filters do not require preservation.
  - Soil samples for all metals are stored not frozen but ≤6°C.
  - Hold times for all metals, except Mercury, are 180 days. Mercury has a hold time of 28 days.

8.0 EQUIPMENT

Instrument Software

- Agilent ICPMS 7700 and 7900 - Mass Hunter - Used for calibration, calculation, QC review, diagnostics, and data storage
- Thermo 7400 ICP - Qtegra - Used for calibration, calculation, QC, review, diagnostics, data storage
- Leeman Hydra II AA – Envoy - Used for calibration, calculation, QC review, diagnostics, data storage
- Perkin Elmer Fims 100- Winlab- Used for calibration, calculation, QC review, diagnostics, data storage

NOTE: All purchased software that is used in conjunction with software specific instruments is guaranteed by the supplier to function as required. The supplier of the software performs all troubleshooting or software upgrades and revisions.

8.2 EQUIPMENT PREVENTIVE MAINTENANCE, EQUIPMENT CALIBRATION

INSTRUMENT	P. M. DESCRIPTION	FREQUENCY
ICP and ICPMS	•Maintain manufacturer's service contract	Renew annually
ICP and ICPMS	•Pump tubing, torch alignment, o-ring, injector tip and torch	Check daily and adjust/change as needed
ICPMS	•Sampler and Skimmer cones	Clean or replace when needed
ICP and ICPMS	•Pump rollers	Clean and lubricate when needed
ICP and ICPMS	•Nebulizer	As needed
Mercury Analyzer	•Calibrate and check sensitivity with previous data	Daily with use
Mercury Analyzer	•Response factor problems, check tubing for leaks, particularly in pump head, and check cell for fogging	As needed
Mercury Analyzer	•Replace desiccant in tube	With each use
Mercury Analyzer	•Check rotometer for airflow, if inadequate, replace flex tubing in pump lead	As needed
TCLP Apparatus (ZHE)	•Change O-rings	As needed
Thermometer	•All working thermometers are compared to a NIST thermometer.	Semi-annually
pH Meter	•Calibrated according to manufacturer's instructions. •The slope is documented and acceptable range 95-105%	Daily
Analytical Balance	•Analytical balances are checked and calibrated by a certified technician semi-annually. •Calibration is checked daily with class S weights. Must be within 0.1% S class weights calibrated annually	Semi-annually Daily
TCLP Tumblers	•Visually timed and confirmed to be 30±2 rpm.	Monthly
Microwaves	•Checked and calibrated by a certified technician	Semi-annually, calibrated weekly by staff
Microwaves	Check cap membranes for leaks	As needed

8.3 STANDARDS AND REAGENTS

All reagents and standards must meet the requirements listed in the analytical methods.

Table 8.3A: Stock Standard sources, receipt, and preparation information.
(subject to revision as needed)

STOCK STANDARD SOURCES
ICP metals used – Ag, Al, As, B, Ba, Be, Ca, Cd, Co, Cr, Cu, Fe, K, Li, Mg, Mn, Mo, Na, Ni, Pb, Sb, Se, Si, Sn, Sr, Ti, Tl, V, Zn, S
ICP/MS metals used – Ag, As, Ba, Be, Cd, Co, Cr, Cu, Fe, Mn, Mo, Ni, Pb, Sb, Se, Sn, Tl, V, Zn, B, U, Th, Na, Ca, Mg, K, Al, Ti, Sr

8.4 INSTRUMENT CALIBRATION

Mercury Analyzer - SOP Numbers 340384A & 340384B

Calibration of the mercury analyzer is achieved using 5 standards. Acceptable calibration is achieved when the correlation coefficient $\geq$0.995. All results are calculated using software based on the peak area of the sample. A second source ICV is analyzed initially and must recover within $\pm$10% for Methods 7470A/7471A/7471B and within $\pm$5% for method 245.1. A primary source CCV is analyzed after every tenth sample and at the conclusion of the analytical sequence. The CCV must recovery within $\pm$10% for all analyses. Spike analyses are performed on 5% of the samples analyzed using EPA Method 7470A/7471A/7471B and on 10% of the samples analyzed using EPA Method 245.1.

Inductively Coupled Plasma (ICP and ICPMS) - SOP Numbers 340386 & 340390

, Thermo 7400 ICP and Agilent ICPMS 7700, 7900 and calibrated using at least 3 standards. A new calibration curve is analyzed daily. All calculations are performed by software using computerized linear regression. The linear regression correlation coefficient for the each analyte in the calibration curve lines must be 0.995 or better for all methods, except for EPA 6010C and 6020A which must have a correlation coefficient of 0.998 or better, A second source ICV is run initially and a primary source CCV is run after every tenth sample. For method 200.7, the ICV must recover within 5% of the true value and for all other methods, the ICV must recover within 10% for methods 6010B/C/D, 6020, 6020A/B, and 200.8. The CCV for all methods must recover within 10% of the true value. Duplicate and spike analyses are performed on 5% of the samples for EPA Methods 6010B, 6010C, 6010D, 6020, 6020A, 6020B and on 10% of the samples analyzed using EPA Methods 200.7 & 200.8.

Zinc	0.05 – 7.5	0.001 - 0.2	
Mercury			Blank, 0.0002 - 0.010

8.5 ACCEPTANCE/REJECTION OF CALIBRATION

The initial calibration curve is compared with previous curves for the same analyte. All new standard curves are immediately checked with a secondary source or laboratory control standard prepared from a separate source than those used for calibration. All curves are visually reviewed to ensure that acceptable correlation represents linearity. Calibration curves may be rejected for nonlinearity, abnormal sensitivity, or poor response of the laboratory control standard. Specific criteria for each instrument are outlined in Table 8.5.

Continuing calibration verification is performed after every tenth sample. If a check standard does not perform within established criteria then the instrument is evaluated to determine the problem. Once the problem is corrected, all samples between the last in control sample and the first out of control check are re-analyzed.

TABLE 8.5 INSTRUMENT CALIBRATION & QC

Instrument (Analysis)	Calibration Type	Number of Standards	Acceptance/ Rejection Criteria	Frequency
ICP & ICPMS	Linear/ Initial	3 - 5	6010B, 6020, 200.7 200.8: Must have a correlation coefficient of at least 0.995. 6010C/D, 6020A/B: Must have a correlation coefficient of at least 0.998	Daily
ICP & ICPMS	Initial	Secondary source (ICV)	6010B, 6010C/D, 6020, 6020A/B, 200.8: ICV must be within +/-10%; 200.7: ICV must be within +/-5%	After initial calibration
ICP & ICPMS	Initial	1 Initial Calibration Blank	< ½ RL, concentrations of common laboratory contaminants shall not exceed the RL	After initial calibration
ICP, ICPMS, Mercury	Continuing	1 mid-level ref. std. (CCV)	Must be within ±10%	Every 10th sample
ICP & ICPMS, Mercury	Continuing	1 Continuing Calibration Blank	< RL, concentrations of common laboratory contaminants must not exceed the RL	Every 10th sample
ICP & ICPMS	Continuing	1 ICSA 1 ICSAB	Must be within ±20% for ICP and ICPMS	After initial calibration, at end and every 8 hours of run time.
ICP, ICPMS, Mercury	Continuing	1 Method Blank	< RL (<1/2 RL for DOD).	1 per batch
ICP, ICPMS, Mercury	Continuing	1 Laboratory Control Standard	200.8, 200.7, 245.1: LCS must be within 15%. 6010B, 6010C/D,6020, 6020A/B,7470A, 7471A/B must be within 20%	1 per batch
ICP & ICPMS	Continuing	1 Matrix Spike (MS), 1 Matrix Spike Duplicate (MSD)	6010B, 6010C/D, 6020, 6020A/B: Spike must be within ±25%, 200.8, 200.7 must be within 30%. MS and MSD must have an RPD ≤20%	1 of each per batch

TABLE 8.5 INSTRUMENT CALIBRATION & QC				
Instrument (Analysis)	**Calibration Type**	**Number of Standards**	**Acceptance/ Rejection Criteria**	**Frequency**
Mercury	Linear/ Initial	3 - 5	Must have a correlation coefficient of at least 0.995	Daily
Mercury	Initial	Secondary source (ICV)	7470A, 7471: ICV must be within ±10% 245.1: ICV must be within ±5%	After initial calibration
Mercury	Continuing	1 Matrix Spike (MS), 1 Matrix Spike Duplicate (MSD)	7470A, 7471A/B: Spike must be within ±25%, 245.1 must be within 30%. MS and MSD must have an RPD ≤20%	1 of each per batch

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

Reagent grade water is obtained from an ELGA Purelab Ultra system.

9.2 GLASSWARE WASHING AND STERILIZATION PROCEDURES

Much of the glassware used in metals preparation is disposable; however non-disposable glassware involved in metals preparation is washed with soap and water, rinsed in 1+1 nitric acid, and rinsed in DI water. Through digestion blanks, it has been determined that chromic acid washing is unnecessary. Glassware with visible gummy deposits remaining after washing is disposed of properly. All metals glassware is given another DI water rinse immediately prior to use. Metals glassware is segregated from all other glassware.

10.0 ANALYTICAL PROCEDURES

10.1 A list of laboratory SOPs associated with the metals laboratory can be found in the following table.

TABLE 10.1: METALS DEPARTMENT SOPS

This table is subject to revision without notice

SOP #	Title
TCLP SOPs	
340358	TCLP
340704	SPLP
340363	EP TOX
340364	MEP
340705	California Waste Extraction Test
Mercury SOPs	
340384A	Mercury in Liquid Waste (Cold-Vapor Technique) 7470A/245.1
340384B	Mercury in Solid Waste (Cold-Vapor Technique) 7471A
Metals Prep SOPs	
340389	Acid Digestion of Aqueous Samples and Extracts Method 3005A/3010A/3015/3030C
340380	Digestion of Metals and Trace Elements in DW and Wastes Method 200.2
340388	Acid Digestion of Sediments, Sludge, Soils and Oils Method 3050B/3051

SOP #	Title
340354A	Turbidity-Metals Drinking Water Screen Only (EPA Method 180.1)
340392	Sodium Absorption Ratio
Metals Analysis SOPs	
340386	Metals by ICP Method 6010, 200.7
340390	Metals by ICP-MS Method 6020, 200.8

11.0 QUALITY CONTROL CHECKS

NOTE: For specific guidance on each determinative method, including required quality control and specific state requirements/modifications, refer to the relevant laboratory standard operating procedure(s).

11.1 ESC participates in proficiency testing (PTs) in support of various laboratory accreditations/recognitions. Environmental samples are purchased from Phenova. The WS, WP and solid matrix studies are completed every 6 months. All proficiency testing samples are received and analyzed by method according to the vendor's instructions and according to the applicable analytical SOP.

11.2 Initial Demonstrations of Capability (IDOCs) are performed during new analyst training and/or prior to acceptance and use of any new method/instrumentation. Continuing Demonstration of Capability (CDOCs) must be updated at least annually. The associated data is filed within the department and available for review.

11.3 Matrix Spike and Matrix Spike Duplicates are performed on 5–10% of samples analyzed depending on analytical method requested. For methods 6010, 6020, 7470A and 7471A duplicates, matrix spikes and matrix spike duplicates are performed on 5% of samples. For methods 200.7, 200.8 and 245.1, the same QC is performed on 10% of samples. The RPD must not exceed 20%.

11.4 A laboratory control sample (LCS) is analyzed one per batch of samples. The acceptance criteria for all water samples is ±15% for 245.1, 200.7, and 200.8. All other methods have an acceptance criteria of ±20%.

11.5 A method preparation blank is performed per batch of samples processed. If the reporting limit [RL] is exceeded, the laboratory evaluates whether reprocessing of the samples is necessary, based on the following criteria:

- The blank contamination exceeds a concentration greater than 1/10 of the measured concentration of any sample in the associated preparation batch or
- The blank contamination is greater than 1/10 of the specified regulatory limit.

The concentrations of common laboratory contaminants must not exceed the reporting limit. Any samples associated with a blank that fail these criteria are re-processed in a subsequent preparation batch, except when the sample analysis resulted in non-detected results for the failing analytes.

12.0 DATA REDUCTION, VALIDATION, AND REPORTING

12.1 DATA REDUCTION

The analyst performs the data calculation and is responsible for the initial examination of the finished data. Data reduction steps applied to the raw data are outlined in ESC SOP #030201, *Data Handling and Reporting.* A secondary review of the data package is performed according to ESC SOP #030227, *Data Review*. The reviewer verifies that the analysis has been performed as required and meets method criteria, all associate data is present and complete, and also ensures that any additional documentation is completed as required (i.e. Ohio VAP checklists, required flags on test reports, etc.)

12.2 VALIDATION

The validation process consists of data generation, reduction review, and reporting results. Once data reduction is complete, validation is conducted by verification that the QC samples are within acceptable QC limits and that all documentation is complete, including the analytical report and associated QC. See Table 12.1 for current QC targets and controls and current reporting limits.

12.3 REPORTING

Reporting procedures are documented in SOP #030201, *Data Handling and Reporting.*

Table 12.3: QC Targets for Environmental Metals Accuracy (LCS), Precision and RLs
(subject to revision without notice)

Class	Analyte	Prep Method	Analysis Method	Matrix	Accuracy Range (%)	Precision (RPD)	RL (ppm)
(ICP-AES)	Aluminum	200.2 NPDES	200.7	Liquid/Aqueous	85 - 115	<20	0.20
(ICP-AES)	Aluminum	3015/3010	6010B/C/D	Liquid/Aqueous	80 - 120	<20	0.20

13.0 CORRECTIVE ACTIONS

13.1 In the event that a nonconformance occurs in conjunction with the analytical batch, a corrective action response (CAR) form must be completed. The cause of the event is stated on the form and the measures taken to correct the nonconformance clearly defined. The effectiveness of the corrective action must be assessed and noted. The CARs are kept on file by the Regulatory Affairs Department. Corrective action procedures are documented in SOP #030208, *Corrective and Preventive Action*

13.2 Required Corrective Action

Control limits have been established for each type of analysis. When these control limits are exceeded, corrective action must be taken. Calculated sample spike control limits are also used.

All samples and procedures are governed by ESC's quality assurance program. General corrective actions are as follows; however additional and more specific direction is provided in the specific determinative procedure. For more information, see the appropriate determinative SOP

13.2.1 Laboratory QC Criteria and Appropriate Corrective Actions

If the analytical method contains acceptance/rejection criteria and it is more stringent than those controls generated by the laboratory, the method criteria takes precedence.

13.2.2 Calibration Verification Criteria Are Not Met: Inorganic Analysis

Rejection Criteria - See Table 8.5.

Corrective Action - If a standard curve linearity is not acceptable and/or the absorbance for specific standard(s) is not analogous to historic data, the instrument settings, nebulizer, etc. are examined to ensure that nothing has been altered, clogged, etc. The working standards are made fresh, intermediate dilutions are re-checked and the instrument is re-calibrated. If a problem persists, the Department Supervisor is notified for further action.

If the initial reference check sample is out of control, the instrument is re-calibrated and the check sample is rerun. If the problem continues the check sample is re-prepared. If the problem still exists then the standards and reagent blank are re-prepared. If the problem persists, the Department Supervisor is notified for further action.

13.2.3 Out Of Control Blanks: Applies to Method, Trip, Rinsate & Instrument Blanks

Rejection Criteria - Blank reading is more than the RL for Method Blanks and/or Instrument Blanks. (½ the RL for Method Blanks and/or instrument blanks for DoD work and also may be required for some customers and programs.)

Corrective Action - Standard curves and samples are evaluated for any obvious contamination that may be isolated or uniform throughout the sequence. If necessary, reagents, QC samples and field samples are re-prepared and re-analyzed. Re-analyses are not initiated until the cause of the contamination is identified and resolved. If samples have already been partially prepared or analyzed, the Department Supervisor is consulted to determine if data needs to be rejected or if samples need to be re-prepped.

13.2.4 Out Of Control Laboratory Control Standards (LCS)

Rejection Criteria - If the performance is outside of lab-generated control (Listed in Table 12.3).

Corrective Action - Instrument settings are checked. The LCS standard is re-analyzed. If the LCS is still out of control, re-calibration is performed, and samples affected since the last in control reference standard are re-analyzed. If the LCS fails again after re-calibration, the entire workgroup must be re-prepped. The Department Supervisor is consulted for further action.

13.2.5 Out Of Control Matrix Spike Samples

Rejection Criteria - If either the MS or MSD sample is outside the established control limits.

Corrective Action - Any compound that is outside of these limits is considered to be 'out of control' and must be qualified appropriately. Batch acceptance, however, is based on method blank and LCS performance, not on MS/MSD recoveries. Specific methods, customers, and programs may require further corrective action in some cases.

13.2.8 Out Of Control Calibration Standards: ICV, CCV, SSCV

”

Rejection Criteria - If the performance is outside of method requirements.

Corrective Action - Instrument settings are checked, calibration verification standard is rerun. If the standard is still out of control, re-calibration is performed, and samples affected since the last in control reference standard are rerun. The Department Supervisor is consulted for further action.

13.3 Responsibility - It is the Department Supervisor's responsibility to evaluate the validity of the corrective action response and submit it to the QA department for processing. In addition, the Supervisor is responsible for appointing the appropriate person within the department to be responsible for correcting the nonconformance. When a corrective action warrants a cessation of analysis, the following personnel are responsible for executing the "stop work order:

- Laboratory Manager
- QA Department
- Department Supervisor
- Technical Service Representative

14.0 RECORD KEEPING

Record keeping is outlined in SOP #030230, *Standards Logger, SOP #030227, Data Review* and SOP #030201, *Data Handling and Reporting*

15.0 QUALITY AUDITS

System and data quality audits are outlined in the ESC Quality Assurance Manual Version 12.0 and *SOP #010104, Internal Audits.*

" "

16.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix V)	General – Replaced the term "client with the term "customer Section 7.1 – Revised to state all soils are stored <6°C not just soils for Hg Section 8.0 – Updated Software Table 8.1 – Updated Equipment List Tables 8.3A and 8.3B – Updated Standards Table 8.4 – Updated range of calibration standards Table 10.1 – Updated SOP List Section 11.1 – Removed AIHA PTs Section 11.4 – Removed AIHA LCS Section 12.3 – Removed AIHA QC Table Table 12.3 – Updated RLs and added Thorium by ICP/MS

(615) 758-5858

NOTE: The QAM has been approved by the following people.

7/13
Chris Johnson, B.S., Organics Manager 615-773-9774

Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Manager, 615-773-9684

Heidi Ferrell, B.S., Volatiles Supervisor, 615-773-9799

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This appendix discusses specific QA requirements for general analytical protocols to ensure analytical data generated from the Volatiles (VOC) laboratory are scientifically valid and are of acceptable quality. Any deviations from these requirements and any deviations that result in nonconforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in *Section 4.0 in the ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

Heidi Ferrell, with a B.S. degree in Chemistry, is the Department Supervisor and is responsible for the overall production of the department; including the management of the staff and scheduling. Ms. Ferrell has 10 years of environmental laboratory experience. In her absence, Brett Andersen assumes responsibility for departmental decisions in the Volatiles Lab.

Brett Andersen, with a B.S in Microbiology and M.S. in Plant Microbiology and Pathology, is the Primary Analyst for the Volatiles Lab. He is proficient in volatile organic analytical methods and has 10 years of environmental laboratory experience.

5.2 TRAINING

5.2.1 All new analysts to the laboratory are trained by a Primary Analyst or Supervisor according to ESC protocol. ESC's training program is outlined in *SOP 030205 Technical Training and Personnel Qualifications.* Performance is documented using an initial demonstration of capability (IDOCs) and continuing demonstration of capability (CDOC). On-going acceptable capability in VOC Laboratory is also demonstrated by acceptable participation in the Phenova proficiency testing program (PTs) and using daily Quality Control sample analyses. Documentation of analyst training is maintained on file within the department.

6.0 FACILITIES AND LABORATORY SAFETY

6.1 FACILITIES

The main area of the instrumentation laboratory in Building #2 has approximately 7000 square feet with 700 square feet of bench area and 300 square feet of preparatory area. The lighting standard is fluorescence. The air handling systems are (1) 60-ton units with gas heating and (1) 25-ton unit. The physical and air-handling separations, between this laboratory and other ESC sections, prevent potential cross-contamination between solvent vapor generation and incompatible analytical processes. Waste disposal containers are located in the laboratory and Clean Harbors serves as ESC's waste disposal carrier. Waste handling is discussed in detail in Section 6.0 of the ESC Quality Assurance Manual. ESC's building information guides and site plan are shown in Appendix I.

6.2 LABORATORY SAFETY

- Laboratory access is limited when work is being performed.
- All procedures where chemicals are prepared or splashes may occur are conducted in laboratory exhaust hoods.

ESC's laboratory safety guidelines are detailed in the *ESC Chemical Hygiene Plan.*

7.0 SAMPLING PROCEDURES

7.1 FIELD SAMPLING PROCEDURES, SAMPLE STORAGE, AND HANDLING

- Field Sampling procedures are described in Appendix III of this ESC Quality Assurance Manual. Sample information is recorded and kept on the ESC chain of custody and field logbooks.
- Matrices for VOC environmental analyses include groundwater, wastewater, drinking water, soil, and sludge.
- Sample containers, preservation methods and holding times vary depending on analyses requested. Please see determinative procedures for specific directions.
- Plastic containers or lids may NOT be used for the storage of samples due to sample contamination from the phthalate esters and other hydrocarbons in the plastic.
- Environmental sample containers should be filled carefully to prevent any portion of the sample from coming into contact with the sampler's gloves causing possible contamination.
- Containers for VOC samples should be selected carefully to minimize headspace that could lead to a low bias in the analytical results. Headspace is monitored during sample login and is documented on the Sample Receipt Corrective Action form when observed.

8.2 EQUIPMENT PREVENTIVE MAINTENANCE, EQUIPMENT CALIBRATION

INSTRUMENT	P. M. DESCRIPTION	FREQUENCY
Analytical Balances	•Check with Class "I" weights	Daily; tolerance ±0.1%
Analytical Balances	•Service/Calibration (semiannual contract maintenance and calibration check)	Semiannually

8.2 EQUIPMENT PREVENTIVE MAINTENANCE, EQUIPMENT CALIBRATION		
INSTRUMENT	P. M. DESCRIPTION	FREQUENCY
Refrigerators & Incubators	•Maintenance service	As needed - determined by daily temperature performance checks
Gas Chromatograph Detectors: FID	Change Quartz jet; clean; replace flame tip	As needed - when deterioration is noticeable
Gas Chromatograph Detectors: PID	Change or clean lamp	As needed - when deterioration is noticeable
Gas Chromatograph/Mass Spectrometer	•Autotune Report	Inspected daily
Gas Chromatograph/Mass Spectrometer	•Clean ion source	As needed to maintain high mass resolution
Gas Chromatograph/Mass Spectrometer & Gas Chromatographs	•Replace septum and liner	As needed to maintain injection port inert
Gas Chromatograph/Mass Spectrometer	•Replace vacuum pump oil	Every 6 months
Gas Chromatograph/Mass Spectrometer & Gas Chromatographs	•Replace column	When separation begins to degrade
Archon/ Centurion Autosampler	•Monitor the Daily QC, including internal standards for changes or failure.	Daily with use

8.3 STANDARDS AND REAGENTS

Table 8.3A: Standard stock sources, description and calibration information.
This table is subject to revision without notice

Method	Vendor*	Description	Calibration	Storage Req.	Expiration
8260	Ultra	Gases Mix	Primary	-30°C to 4°C	1 week
	Ultra	Custom Standard	Primary	2°C to 8°C	6 months
	NSI	Mix 2	Primary	2°C to 8°C	6 months
	Restek	Acrolein	Primary	<0°C	3 months
	SPEX	Custom (AZ analytes)	Primary	<0°C	6 months

8.4 INSTRUMENT CALIBRATION

602 - BTEX - SOP Number 330351

The gas chromatograph is calibrated using the internal standard procedure. A standard curve is prepared using a minimum of three concentration levels for each compound of interest. The calibration standards are tabulated according to peak height or area responses against concentration for each compound and response factors are calculated. If the response factors are <10 % RSD over the working range, the average RF can be used for calculations. Alternatively, when the response factor criteria is exceeded, the analyst may utilize a linear calibration model of response ratios (i.e. Area/Ref. Area or Amt./Ref Amt.) for quantitation providing that the correlation coefficient is at least 0.990 (0.995 for USACE Projects). An independent, or second source, calibration verification standard (SSCV) is analyzed after each initial calibration and should recover within ±20% of the expected concentration for each analyte.

During the analytical sequence, the stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of continuing calibration verification (CCV) standards. The CCV must recovery within 15% of the expected concentration for each analyte.

At daily instrument startup and in lieu of performing an entire initial calibration, the working calibration curve or response factors are verified on each working day by the analysis of a Quality Control Check Standard. The responses must meet the criteria found

in Table 2 of the 602 Method. If the responses do not meet these criteria, the analysis must be repeated. If the standard still does not meet the criteria, a new calibration curve is prepared.

8021B - BTEX - SOP Number 330351

The gas chromatograph is calibrated using the internal standard procedure. A standard curve is prepared using a minimum of five concentration levels for each compound of interest.

The calibration standards are tabulated according to peak height or area responses against concentration for each compound and response factors are calculated. If the response factors are <20 % RSD over the working range, the average RF can be used for calculations. Alternatively, the results can be used to plot a calibration curve of response ratios (Area/Ref. Area) vs (Amt./Ref Amt). If the response factors of the initial calibration are <20 % RSD over the calibration range, the average RF can be used for calculations. Alternatively, when the response factor criteria is exceeded, the analyst may utilize a linear calibration model of response ratios (i.e. Area/Ref. Area or Amt./Ref Amt.) for quantitation providing that the correlation coefficient is at least 0.990 (0.995 for USACE Projects). An independent, or second source, calibration verification standard (SSCV) is analyzed after each initial calibration and should recover within ±20% of the expected concentration for each analyte.

At daily instrument startup and in lieu of performing an entire initial calibration, the most recent calibration curve may be verified by the analysis of check calibration verification standard (CCV). If the response for any analyte in this check varies from the predicted response by more than ±20%, the analysis must be repeated using fresh standard. If the standard still does not meet the acceptance criteria, a new initial calibration curve must be generated.

8015B/C/D & State Methods - Gasoline Range Organics - SOP Number 330351

Certain state accreditation/registration programs may have specific requirements for calibration and analysis that must be met. Those requirements supersede the general guidance provided in this section and are addressed in the relevant determinative SOP. For EPA Method 8015 for routine GRO analyses, the gas chromatograph is calibrated using the internal standard procedure. A standard curve is prepared using a minimum of five concentration levels for each analyte of interest. The calibration range must represent the typical environmental sample concentration and include the RL as the lowest calibration point. The linear range of the instrument must also be monitored to ensure that the maximum calibration point is within detection range. The calibration standards are tabulated according to peak height or area responses against concentration for each compound and response factors are calculated. If the response factors of the initial calibration are <20 % RSD over the calibration range, the average RF can be used for calculations. Alternatively, when the response factor criteria is exceeded, the analyst may utilize a linear calibration model of response ratios (i.e. Area/Ref. Area or Amt./Ref Amt.)

for quantitation providing that the correlation coefficient is at least 0.990 (0.995 for USACE DOD Projects). An independent, or second source, calibration verification standard (SSCV) is analyzed after each initial calibration and should meet criteria of ±20% of the expected concentration for each analyte.
The working calibration curve or response factors are verified on each working day by the analysis of one or more calibration standards. If the response of any analyte varies from the predicted response by more than 20% RSD, the analysis must be repeated using a new calibration standard. If the standard still does not meet the criteria, a new calibration curve is prepared.

8260B/C, 624, SM6200B, 524.2 - Gas Chromatography/Mass Spectrometry (GC/MS): Volatile Organics - SOP Numbers 330363 & 330364

Detector mass calibration is performed daily using the autotune function of the GC/MS analytical system and BFB (Bromofluorobenzene). Following verification of the appropriate masses, the instrument sensitivity is verified by injecting a tuning solution containing bromofluorobenzene (BFB). The BFB spectra must meet the following ion abundance criteria:

Mass	Ion Abundance Criteria
50	15 to 40% of mass 95
75	30 to 60% of mass 95
95	base peak, 100% relative abundance
96	5 to 9% of mass 95
173	Less than 2% of mass 174
174	greater than 50% of mass 95
175	5 to 9% of mass 174
176	greater than 95% but less than 101% of mass 174
177	5 to 9% of mass 176

Successful tuning must occur every 12 hours for method 524.2, 8260B/C & SM6200B and every 24 hours for method 624.

Following successful tuning, the GC/MS is calibrated using the internal standard procedure. A standard curve is prepared using a minimum of three standards for method 624, 524.2 and five standards for method 8260B/C and SM6200B. The calibration standards are tabulated according to peak height or area against concentration and the concentrations and responses of the internal standard analytes. The results are used to determine a response factor for each analyte in each standard injected. A calibration curve is constructed and is determined to be acceptable if each target analyte is found to be constant over the working range as defined as:

≤15% RSD for methods 8260B
≤20% RSD for method 524.2, 8260C, SM6200B
≤35% RSD for method 624

Per the analytical method, specific target analytes are defined as calibration check compounds (CCCs) or system performance check compounds (SPCCs). The calibration checks compounds (CCCs) for method 8260B must be ≤30% RSD. When these conditions are met, linearity through the origin can be assumed and the average RF can be used in place of a calibration curve.

Linear regression can be used for any target compound exceeding the RSD criteria but less than 40% (poor performers <50%), if the correlation coefficient is 0.990 or better. For USACE/DOD projects the correlation coefficient must meet 0.995 or better. The same is true for the CCCs in EPA 8260B as long as the RSD does not exceed 30%.

8260B SPCCs:	
Analyte	**Minimum Average Response Factor**
Chloromethane	0.10
1,1-Dichloroethane	0.10
Bromoform	0.10
Chlorobenzene	0.30
1,1,2,2-Tetrachloroethane	0.30

8260B CCCs:	
1,1-Dicholoethene	Toluene
Chloroform	Ethylbenzene
1,2-Dichloropropane	Vinyl Chloride

The initial calibration range must represent the typical environmental sample and include the RL as the lowest calibration point. The linear range of the instrument must be monitored to ensure that the maximum calibration point is within the range.

A second source calibration verification standard is analyzed after each calibration. The second source should recover within 30% for all CCC compounds and within 40% for other analytes of interest, with the exception of analytes known to perform poorly (i.e. low purging efficiency, etc.) that will meet historical LCS accuracy limits. For 524.2 the second source calibration verification standard must be within ± 30%. Following successful calibration, the analysis of field and QC samples may begin. Sample analysis may be performed only during the timeframe of a valid tuning cycle (12 hours for 8260B, 524.2 & SM6200B and 24 hours for 624). Following the expiration of the tuning clock, the instrument must be re-tuned and either recalibrated or the existing calibration must be re-verified.

For 8260B/C, 524.2 & SM6200B analyses, daily calibration verification includes successful demonstration of BFB sensitivity and the injection of a mid-level CCV standard containing all the target analytes of interest and all required system monitoring compounds, where applicable. The BFB tune must meet the ion abundance criteria (see table above). For 8260B, each SPCC in the calibration verification standard must meet the minimum response factors listed above. The CCC must achieve the criteria of +/- 20% RSD. For 524.2 & SM6200B, each target analyte must achieve a drift or difference

of +/-30% of the expected concentration. For V8260C each target analyte must achieve a drift or difference of +/-20% of the expected concentration.
Each internal standard in the CCV must recover between -50% to + 100%, when compared to the same internal standard compound in the mid-point standard of the initial calibration curve. Additionally, if the retention time of an internal standard changes by more than 30 seconds from the retention time of the same internal standard in the mid-level standard of the most recent initial calibration, the system must be evaluated, corrected, and possibly re-calibrated.

Daily calibration is accomplished for method 624 by a BFB tuning and analysis of a QC check standard. The BFB tune must meet EPA ion abundance criteria. The QC check standard must meet the criteria found in table 5 of the method.

Poor performing compounds for 8260B/524.2/SM6200B/624:

Propene	2-Chloroethylvinyl Ether
Dichlorodifluoromethane	Acrolein
Carbon Disulfide	Vinyl acetate
Bromomethane	trans-1,4-dichloro-2-butene
Chloroethane	Alcohols (Ethanol, TBA, TAA, ETBA, Butanol)
1,3-Butadiene	Iodomethane.
2,2-Dibromo-3-chloropropane	Naphthalene
1- Methylnaphthalene	2-Butanone
2- Methylnaphthalene	2-Hexanone
Acetone	4-Methyl-2-pentanone
Pentachloroethane	Cyclohexanone
Tert-butyl Formate	

8.5 ACCEPTANCE/REJECTION OF CALIBRATION

Organic Chemistry

The initial calibration curve is compared with previous curves for the same analyte. All new standard curves are immediately checked with a secondary source or laboratory control standard prepared from a separate source than those used for calibration. All curves are visually reviewed to ensure that acceptable correlation represents linearity. Calibration curves may be rejected for nonlinearity, abnormal sensitivity, or poor response of the laboratory control standard.

Continuing calibration verification is performed on each day that initial calibration is not performed and following every tenth sample for GC analyses and once per 12 hour shift for GCMS analyses. If a check standard does not perform within established criteria, the instrument is evaluated to determine the cause. Once the issue is corrected, all samples between the last in control sample and the first out of control check is re-analyzed.

TABLE 8.5: INSTRUMENT CALIBRATION

Instrument (Analysis)	Calibration Type	Minimum Number of Standards	Calibration Model	Acceptance/ Rejection Criteria	Frequency
GC (VOC)	Initial	3 –600 series	Avg. RF	Must be ≤10% RSD for 601/602,	As needed
		5 –All others	Avg. RF	≤20%RSD for 8021B, and ≤20% difference for 8015B	
	Second Source	1 Second Source	External	+/- 20% of true value	With each calibration
	Daily / Cont.	1/10	External	Must be within 20% of the initial calibration curve	Beginning, every 20
			Internal	Must be within 20% of the initial calibration curve	Every 12 hours
GC/MS VOC 8260/SM 6200B	Initial	5 –8000 series & SM 6200B	Avg. RF	8260B - Must be ≤15 %RSD for all target analytes and ≤30% for CCCs. 8260C - Must be ≤20 %RSD for all target analytes and ≤30% for CCCs. 6200B - Must be ≤20 %RSD for all target analytes. If Linear regression is used, an MRL check must pass +/-30%.	As needed
	Second Source	1 Second Source		8260B - Should recover within 20% for all CCC compounds and within 40% for other analytes of interest, with the exception of analytes known to perform poorly. 6200B – Should recover within 30% for all compounds, with the exception of analytes known to perform poorly	With each calibration
	Daily / Cont.	Tune & CCV every 12 hours		8260B/C - Must pass established method tuning criteria; 8260B - CCV must be ≤20% difference for CCC compounds, RF criteria for SPCC compounds must meet method criteria. Targets must meet ESC %drift criteria. 8260C/6200B – All targets meet designated minimum response factor, and all compounds ≤20% difference and 30% difference respectively, however for EPA 8260C, 20% of target compounds can fail. If any failures, an MRL check is analyzed.	Every 12 hours

Instrument (Analysis)	Calibration Type	Minimum Number of Standards	Calibration Model	Acceptance/ Rejection Criteria	Frequency
GC/MS VOC 624	Initial	3 –600 series	Avg. RF	624 - Must be ≤35 %RSD for all target analytes and ≤30% for CCCs	As needed
	Second Source	1 Second Source		Should recover within 20% for all CCC compounds and within 40% for other analytes of interest, with the exception of analytes known to perform poorly	With each calibration
	Daily / Cont.	Tune & CCV every 12 hours		Must pass established method tuning criteria; 624 - CCV must be ≤20% difference for CCC, RF for SPCC compounds must meet method criteria. Targets must meet ESC %drift criteria.	Every 12 hours

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

Reagent grade water is obtained from an ELGA Purelab Ultra system.

9.2 GLASSWARE WASHING PROCEDURE

All VOA sampling vials are purchased specifically for volatiles analysis and only used once. They are stored in a contaminant-free environment in the original carton with screw cap lids tightly fastened. All glassware used for volatiles analysis (volumetric flasks, syringes, etc.) is segregated from other laboratory glassware. Standard cleaning procedures involve rinsing three times with methanol. When a highly contaminated sample is purged, a blank is analyzed before another sample can be purged to ensure cleanliness of the analytical system. If the blank proves to be contaminant free, the system is then ready for further field sample analyses.

10.0 ANALYTICAL PROCEDURES

10.1 A list of laboratory SOPs associated with the volatiles laboratory can be found in the following table:

TABLE 10.1: VOLATILE DEPARTMENT SOPS

This table is subject to revision without notice

SOP #	Title/Description
330351	BTEX and Gasoline Range Organics by Gas Chromatography (8015B)
330354	MA Volatile Petroleum Hydrocarbons
330357	Volatile Organic Compounds (GRO by GCMS)
330363OH	Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry 8260A/B (Ohio VAP)
330363	Volatile Organic Compounds by Gas Chromatography/Mass

SOP #	Title/Description
	Spectrometry
330364	DW Volatile Organic Compounds by GC/MS (524.2)
330365	VOC Screen using RAE Systems PID ppbRAE
330375	GRO Analysis in Air (based on EPA 8015)
330751	5035 Closed System Purge and Trap and Extraction for VOC's in Soil and Waste
330751OH	5035 Closed System Purge and Trap and Extraction for VOC's in Soil for Ohio VAP
330752OH	5030B Purge and Trap for OH VAP Samples
330752	5030B Purge and Trap for Aqueous Samples
330753	Waste Dilution

11.0 QUALITY CONTROL CHECKS

NOTE: For specific guidance on each determinative method, including required quality control and specific state requirements/modifications, refer to the relevant laboratory standard operating procedure(s).

11.1 ESC participates in proficiency testing (PTs) in support of various laboratory accreditations/recognitions. Environmental samples are purchased from Phenova. The WS, WP and solid matrix studies are completed every 6 months. PT samples are received and analyzed by method according to the vendor's instructions and according to ESC SOP.

11.2 Initial Demonstrations of Capability (IDOCs) are performed during new analyst training and/or prior to acceptance and use of any new method/instrumentation. Continuing Demonstration of Capability (CDOCs) must be updated at least annually. The associated data is filed within the department and available for review.

11.3 Matrix Spike and Matrix Spike Duplicates are performed on each batch of samples analyzed depending on analytical method requested.

11.4 A Laboratory Control Sample (LCS) and LCS Duplicate (LCSD) are analyzed one per batch of samples.

11.5 A method preparation blank is performed per batch of samples processed. If the acceptance criteria as listed in the determinative SOP is exceeded, the laboratory shall evaluate whether reprocessing of the samples is necessary, based on the following criteria:

- The blank contamination exceeds a concentration greater than 1/10 of the measured concentration of any sample in the associated preparation batch or
- The blank contamination is greater than 1/10 of the specified regulatory limit. The concentrations of common laboratory contaminants shall not exceed the reporting limit.

Any samples associated with a blank that fail these criteria shall be reprocessed in a subsequent preparation batch, except where the sample analysis resulted in non-detected results for the failing analytes.

12.0 DATA REDUCTION, VALIDATION AND REPORTING

12.1 DATA REDUCTION

The analyst performs the data calculation functions and is responsible for the initial examination of the finished data. Data reduction steps applied to the raw data are outlined in SOP #030201, *Data Handling and Reporting.* A secondary review of the data package is performed according to ESC SOP #030227, *Data Review*. The reviewer verifies that the analysis has been performed as required and meets method criteria, all associate data is present and complete, and also ensures that any additional documentation is completed as required (i.e. Ohio VAP checklists, required flags on test reports, etc.)

TABLE 12.1 Data Reduction Formulas

PARAMETER	FORMULA
GC	response of sample analyte {*area*} x final extract volume {*mL*} x dilution response factor {*area/(mg/L)*} x initial extract volume-mass {*mL or g*} *Calculations performed by HP Enviroquant Software*
GC/MS	response of analyte {*area*} x extract volume {*mL*} x dilution x int. std amt. {*area*} response factor {*area/(mg/mL)*} x initial volume-mass {*mL or g*} x int. std cal. {area} *Calculations performed by HP Enviroquant Software*

12.2 VALIDATION

The validation process consists of data generation, reduction review, and reporting results. Once data reduction is complete, validation is conducted by verification that the QC samples are within acceptable QC limits and that all documentation is complete, including the analytical report and associated QC. See Table 12.3 by method for current QC targets and controls and current reporting limits.

Marginal Exceedance – When a large number of analytes exist in the LCS, it is statistically possible for a few analytes to be outside established control limits while the analytical system remains in control. These excursions must be random in nature and, if not, a review of the control limits or analytical process is necessary.

Upper and lower marginal exceedance (ME) limits are established as the mean of at least 20 data points ± four times their standard deviations. The number of allowable marginal exceedances per event is based on the number of analytes spiked in the LCS.

Allowable Marginal Exceedance per Event	
Analytes in LCS:	**ME Allowable**
>90	5
71-90	4
51-70	3
31-50	2
11-30	1
<11	0

Organic Control Limits - The organic QC targets are statutory in nature; warning and control limits for organic analyses are initially established for groups of compounds based on preliminary method validation data. When additional data becomes available, the QC targets are reviewed. All QC targets are routinely re-evaluated at least annually (and updated, if necessary) against laboratory historical data to insure that the limits continue to reflect realistic, method achievable goals.

12.3 REPORTING

Reporting procedures are documented in SOP #030201, *Data Handling and Reporting.*

Table 12.3: QC Targets for Volatiles Accuracy (LCS), Precision and RLs

*** Specific organizations may require limits that supersede the values listed.*

13.0 CORRECTIVE ACTION

13.1 In the event that a nonconformance occurs in conjunction with the analytical batch, a corrective action response (CAR) form must be completed. The cause of the event is stated on the form and the measures taken to correct the nonconformance clearly defined. The effectiveness of the corrective action must be assessed and noted. The CARs are kept on file by the Regulatory Affairs Department. Corrective action procedures are documented in SOP #030208, *Corrective and Preventive Action*

13.2 Required Corrective Action

Control limits have been established for each type of analysis. When these limits are exceeded, corrective action must be taken. Calculated sample spike control limits are also used.

All samples and procedures are governed by ESC's quality assurance program. General corrective actions are as follows; however additional and more specific direction is provided in the specific determinative procedure. For more information, see the appropriate determinative SOP.

13.2.1 Laboratory QC Criteria and Appropriate Corrective Actions

If the analytical method contains acceptance/rejection criteria and it is more stringent than those controls generated by the laboratory, the method criteria takes precedence.

13.2.2 Out Of Control Blanks: Applies to Method, Trip, Rinsate & Instrument Blanks

Rejection Criteria - Blank reading is more than twice the background absorbance or more than ½RL.

Corrective Action - Blanks are re-analyzed and the response is assessed. Standard curves and samples are evaluated for any obvious contamination that is isolated or uniform throughout the run. If necessary, reagents are re-prepared. Analyses are not initiated until the problem is identified and solved. If samples have already been prepared or analyzed, the Department Supervisor is consulted to determine if data needs to be rejected or if samples need to be re-prepared.

13.2.3 Out Of Control Laboratory Control Standards (LCS & LCSD)

Rejection Criteria - If the performance is outside of lab-generated control limits which are calculated as the mean of at least 20 data points +/- 3 times the standard deviation of those points (Listed in Section 12) and the marginal excedence allowance is surpassed (see section 12.2).

Corrective Action - Instrument settings are checked and the LCS standard is re-analyzed. If the LCS is still out of control, instrumentation is checked for systemic problems and repaired (if necessary). Re-calibration is performed and the samples affected since the last in control reference standard are reanalyzed. The group leader or Department Supervisor is consulted for further action.

13.2.4 Out Of Control Matrix Spike Samples

Rejection Criteria - If either the MS or MSD sample is outside the established control limits.

Corrective Action - Any compound that is outside of these limits is considered to be 'out of control' and must be qualified appropriately. Batch acceptance, however, is based on method blank and LCS performance, not on MS/MSD recoveries. Specific methods, customers, and programs may require further corrective action in some cases.

13.2.5 Out Of Control Duplicate Samples

Rejection Criteria - Lab-generated maximum RPD limit (as listed under precision in Section 12)

Corrective Action - Any compound that is outside of these limits is considered to be 'out of control' and must be qualified appropriately. Batch acceptance, however, is based on method blank and LCS performance. Specific methods, customers, and programs may require further corrective action in some cases.

13.2.7 Out Of Control Calibration Standards: ICV, CCV, SSCV

Rejection Criteria - If the performance is outside of method requirements.

Corrective Action - Instrument settings are checked, calibration verification standard is re-analyzed. If the standard is still out of control, re-calibration is performed, and samples affected since the last in control reference standard are rerun. The group leader or Department Supervisor is consulted for further action.

14.0 RECORD KEEPING

Record keeping is outlined in SOP #030230, *Standards Logger, SOP #030227, Data Review* and SOP #030201, *Data Handling and Reporting*

Volatile organics calibration data are recorded and integrated using HP Enviroquant software. Calibration data from the volatile analyses, in addition to the initial and daily calibration, includes GC/MS autotunes, BFB reports and surrogate recovery reports. PDF records of initial calibration and daily calibration are stored with chromatograms and integrated with sample data by date analyzed.

15.0 QUALITY AUDITS

System and data quality audits are outlined in the ESC Quality Assurance Manual Version 13.0 and *SOP #010104, Internal Audits*.

16.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix VI)	General – Replaced the term “client” with the term “customer” Table 8.1 – Updated Equipment List Table 8.3A – Updated Standards Table 10.1 – Updated SOP List

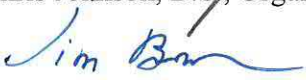
NOTE: The QAM has been approved by the following people.

Chris Johnson, B.S., Organics Manager 615-773-9774



Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Manager, 615-773-9684

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This appendix discusses specific QA requirements for general analytical protocols to ensure that analytical data generated from the Semi-Volatile (SVOC) laboratory are scientifically valid and are of acceptable quality. Any deviations from these requirements and any deviations that result in non-conforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in *Section 4.0 in the ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

Chris Johnson, with a B.S. degree in Biology, is the Organics Manager and is responsible for the overall production of these laboratories; including the management of the staff and scheduling. Mr. Johnson has over 15 years of environmental laboratory experience.

In his absence, Blake Judge assumes responsibility for SVOC departmental decisions. Mr. Judge has a B.S. degree in Chemistry and is a Senior Chemist in the SVOC Department. He is proficient in semi-volatile organic analytical methods and has over 10 years of environmental laboratory experience.

5.2 TRAINING

5.2.1 All new analysts to the laboratory are trained by a Chemist or Department Lead according to ESC protocol. ESC's training program is outlined in *SOP 030205 Technical Training and Personnel Qualifications.* Performance is documented using an initial demonstration of capability (IDOCs) and continuing demonstration of capability (CDOC). On-going acceptable capability in SVOC analyses and preparation is also demonstrated by acceptable participation in multiple proficiency testing programs (PTs) and daily Quality Control sample analyses. Documentation of analyst training is maintained on file within the department.

6.0 FACILITIES AND LABORATORY SAFETY

6.1 FACILITIES

The main area of the instrumentation laboratory in Building #5 has nearly 1500 square feet with approximately 500 square feet of bench area. The 4000 square feet of area in the extraction laboratory includes roughly 330 square feet of bench area with 245 square feet of hood space. There is an additional 2000 square feet of storage for this laboratory. The air system is a 15-ton make-up unit plus 15-ton HVAC with electric heat. The physical and air-handling separations, between this laboratory and other ESC sections, prevent potential cross-contamination between solvent vapor generation and incompatible analytical processes. The laboratory reagent water is provided through the US Filter deionizer system. Waste disposal containers are located in the laboratory and Clean Harbors serves as ESC's waste disposal carrier as discussed in detail in Section 6.0 of the ESC Quality Assurance Manual. ESC's building information guides and site plan are shown in Appendix I.

6.2 LABORATORY SAFETY

- Laboratory access is limited when work is being performed.
- All procedures where chemicals are prepared or splashes may occur are conducted in laboratory exhaust hoods.
- ESC's laboratory safety guidelines are detailed in the *ESC Chemical Hygiene Plan.*

7.0 SAMPLING PROCEDURES

7.1 FIELD SAMPLING PROCEDURES, SAMPLE STORAGE, AND HANDLING

- Field Sampling procedure is described in Appendix III of this ESC Quality Assurance Manual. Sample information is recorded and kept on the ESC chain of custody and field logbooks.
- Matrices for SVOC environmental analyses include groundwater, wastewater, drinking water, soil, and sludge.
- Sample containers, preservation methods and holding times vary depending on analyses requested. Please see determinative procedures for specific directions.
- Plastic containers or lids may NOT be used for the storage of samples due to possible contamination from the phthalate esters and other hydrocarbons.
- Environmental sample containers should be filled carefully to prevent any portion of the sample from coming into contact with the sampler's gloves causing possible phthalate contamination.

8.2 EQUIPMENT PREVENTIVE MAINTENANCE, EQUIPMENT CALIBRATION

INSTRUMENT	**P. M. DESCRIPTION**	**FREQUENCY**
Analytical Balances	•Check with Class "I" weights	Daily-tolerance ±0.1%
Analytical Balances	•Service/Calibration (semi-annual contract maintenance and calibration check)	Semi-annually
Refrigerators & Incubators	•Maintenance service	As needed determined by daily temperature performance checks
Gas Chromatograph Detectors: ECD	•Bake off or Replace •Perform wipe leakage test	GC/detector maintenance is routinely completed as needed for each instrument. Analysts are responsible for performing and documenting maintenance on each component of the instrumentation based on daily performance of the instrument and its
Gas Chromatograph Detectors: FID	•Change Quartz jet; clean; replace flame tip	
Gas Chromatograph/Mass Spectrometer	•Autotune Report	
Gas Chromatograph/Mass Spectrometer	•Clean ion source	

INSTRUMENT	P. M. DESCRIPTION	FREQUENCY
Gas Chromatograph/Mass Spectrometer	•Replace vacuum pump oil	ability to meet certain method requirements. Senior analyst team is available to help with major maintenance issues.
Gas Chromatographs/Mass Spectrometer & Gas Chromatographs	•Replace septa and liner	
Gas Chromatographs/Mass Spectrometer & Gas Chromatographs	•Replace column	
High Intensity Ultrasonic Processor - Misonix	•Check tuning criteria	Daily with use
Infrared Spectrophotometer - Foxboro Miran 1A	•Optics alignment or replacement	As needed when response begins to deteriorate

8.4 INSTRUMENT CALIBRATION

608/8081A or B/SM6630C - Chlorinated Pesticides – SOP Number 330344

The gas chromatograph is calibrated using either the internal or external standard calibration model. A standard curve is prepared using a minimum of three concentration levels for each compound of interest for method 608. A minimum of five concentration levels is necessary for methods 8081A/B and SM6630C. The calibration range must represent the typical environmental sample concentration and include the RL as the lowest calibration point. The linear range of the instrument must also be monitored to ensure that the maximum calibration point is within detection range. The calibration standards are tabulated according to peak height or area responses against concentration or ISTD response for each compound and calibration/response factors are calculated. If performing analysis by method 608 and the response factors of the initial calibration are

< 10 % RSD for method 608 and 20% RSD for methods 8081A/B and 6630C over the calibration range, the average RF can be used for calculations. Alternatively, when the response factor criteria is exceeded, the analyst may utilize a linear calibration model of response ratios (i.e. Area/Ref. Area or Amt./Ref Amt.) for quantitation providing that the correlation coefficient is at least 0.990.

During the analytical sequence, the stability of the initial calibration curve is verified, following every 20th sample for external calibration and every 12 hours if monitoring ISTD, by the analysis of a continuing calibration verification (CCV) standard. The CCV must recover within 15% of the expected concentration for each analyte.
At daily instrument startup and in lieu of performing an entire initial calibration, the most recent calibration curve may be verified by the analysis of initial calibration verification standard (ICV). If the response for any analyte in this check varies from the predicted response by more than ±15%, the analysis must be repeated using fresh standard. If the standard still does not meet the acceptance criteria, a new initial calibration curve must be generated.

An independent, or second source, calibration verification standard (SSCV) is analyzed after each initial calibration and should recover within ±20% of the expected concentration for each analyte. When analyte responses in field samples exceed the calibration range, the sample is diluted and re-analyzed.

Degradation if DDT and Endrin are also verified at least every 12hr window. Breakdown should recover less 20% of the total injection.

507 - Nitrogen/Phosphorus Pesticides - SOP Number 330348

The gas chromatograph is calibrated using the external standard procedure. A standard curve is prepared using a minimum of three concentration levels for each compound of interest for method 507. The calibration range must represent the typical environmental sample concentration and include the RL as the lowest calibration point. The linear range of the instrument must also be monitored to ensure that the maximum calibration point is within detection range. The calibration standards are tabulated according to peak height or area responses against concentration for each compound and response factors are calculated. If the response factors of the initial calibration are ≤20 % RSD over the calibration range, the average RF can be used for calculations. Alternatively, when the response factor criteria is exceeded, the analyst may utilize a linear calibration model of response ratios (i.e. Area/Ref. Area or Amt./Ref Amt.) for quantitation providing that the correlation coefficient is at least 0.990.

During the analytical sequence the stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of a continuing calibration verification (CCV) standard. The CCV must recovery within 20% of the expected concentration for each analyte.

At daily instrument startup and in lieu of performing an entire initial calibration, the most recent calibration curve may be verified by the analysis of check calibration verification standard (CCV). If the response for any analyte in this check varies by more than ±20% from the initial calibration, the analysis must be repeated using fresh standard. If the standard still does not meet the criteria, a new initial calibration curve must be generated.

A Quality Control Sample (QCS) is analyzed at a minimum quarterly to verify calibration standards.

552.2 - HAA - SOP Number 330319

The gas chromatograph is calibrated using the internal standard procedure. A standard curve is prepared using a minimum of five concentration levels for each compound of interest. The calibration range must represent the typical environmental sample concentration and include the RL as the lowest calibration point. The linear range of the instrument must also be monitored to ensure that the maximum calibration point is within detection range. The calibration standards are tabulated according to peak height or area responses against concentration for each compound and response factors are calculated. If the response factors of the initial calibration are ≤20 % RSD over the calibration range, the average RF can be used for calculations. Alternatively, when the response factor criteria is exceeded, the analyst may utilize a linear calibration model of response ratios (i.e. Area/Ref. Area or Amt./Ref Amt.) for quantitation providing that the correlation coefficient is at least 0.990.

During the analytical sequence the stability of the initial calibration is verified, following every 10th sample and at the end of the sequence, by the analysis of a continuing calibration verification (CCV) standard. The response of the analytes in the CCV must not vary more than 30% from the initial calibration.

At daily instrument startup and in lieu of performing an entire initial calibration, the most recent calibration curve may be verified by the analysis of check calibration verification standard (CCV). If the response for any analyte in this check varies by more than ±30% from the initial calibration, the analysis must be repeated using fresh standard. If the standard still does not meet the criteria, a new initial calibration curve must be analyzed.

A Quality Control Sample (QCS) is analyzed at a minimum quarterly to verify calibration standards.

8151A, SM6640B – Herbicides - SOP Number 330320

The gas chromatograph is calibrated using the external standard procedure. A standard curve is prepared using a minimum of five concentration levels for each analyte of interest. The calibration range must represent the typical environmental sample concentration and include the RL as the lowest calibration point. The linear range of the instrument must also be monitored to ensure that the maximum calibration point is within

detection range. The calibration standards are tabulated according to peak height or area responses against concentration for each compound and response factors are calculated. If the response factors of the initial calibration are ≤20 % RSD over the calibration range, the average RF can be used for calculations. Alternatively, when the response factor criteria is exceeded, the analyst may utilize a linear calibration model of response ratios (i.e. Area/Ref. Area or Amt./Ref Amt.) for quantitation providing that the correlation coefficient is at least 0.990.

During the analytical sequence, the stability of the initial calibration is verified following every 10th sample and at the end of the sequence by the analysis of a continuing calibration verification (CCV) standard. The CCV must recovery within 15% of the expected concentration for each analyte for method 8151A and within 20% for method 6640C. The value of the CCV can exceed the criteria for a single compound provided that all samples in the analytical batch are BDL (below detection limit). The concentration of the continuing check standard must be routinely varied to verify the entire calibration range.

At daily instrument startup and in lieu of performing an entire initial calibration, the most recent calibration curve may be verified by the analysis of check calibration verification standard (CCV). If the response for any analyte in this check varies from the predicted response by more than ±15%, the analysis must be repeated using fresh standard. If the standard still does not meet the criteria, a new initial calibration curve must be generated.

An independent, or second source, calibration verification standard (SSCV) is analyzed after each initial calibration and should recover within ±20% of the expected concentration for each analyte. When sample responses exceed the calibration range, the sample is diluted and re-analyzed.

8141A, 1657A – Organophosphorus Pesticides - SOP Number 330318

The gas chromatograph is calibrated using either the internal or external standard calibration model. A minimum of five concentration levels is necessary for methods 8141A and 1657A. The calibration range must represent the typical environmental sample concentration and include the RL as the lowest calibration point. The linear range of the instrument must also be monitored to ensure that the maximum calibration point is within detection range. The calibration standards are tabulated according to peak height or area responses against concentration or ISTD response for each compound and calibration/response factors are calculated. If the response factors of the initial calibration are ≤20 % RSD over the calibration range, the average RF can be used for calculations. Alternatively, when the response factor criteria is exceeded, the analyst may utilize a linear calibration model of response ratios (i.e. Area/Ref. Area or Amt./Ref Amt.) for quantitation providing that the correlation coefficient is at least 0.990.

During the analytical sequence, the stability of the initial calibration is verified following every 20th sample by the analysis of a continuing calibration verification (CCV) standard for external calibration or at the beginning of every 12hrs for ISTD calibration. The CCV must recovery within 15% of the expected concentration for each analyte. The concentration of the continuing check standard must be routinely varied to verify the entire calibration range.

At daily instrument startup and in lieu of performing an entire initial calibration, the most recent calibration curve may be verified by the analysis of check calibration verification standard (CCV). If the response for any analyte in this check varies from the predicted response by more than ±15%, the analysis must be repeated using fresh standard. If the standard still does not meet the criteria, a new initial calibration curve must be generated. An independent, or second source, calibration verification standard (SSCV) is analyzed after each initial calibration and should recover within ±20% of the expected concentration for each analyte. When sample responses exceed the calibration range, the sample is diluted and re-analyzed.

625, 8270C or D, SM6410B - Base/Neutrals/Acids by GC/MS: Semivolatile Organics – SOP Number 330345

Detector mass calibration is performed using the autotune function of the GC/MS analytical system and PFTBA (Perfluorotributylamine). Following verification of the appropriate masses, the instrument sensitivity is verified by injecting a tuning solution containing decafluorotriphenylphosphine (DFTPP), benzidine, pentachlorophenol and DDT. The DFTPP must meet the ion abundance criteria specified by the EPA published method. Benzidine and pentachlorophenol are reviewed for tailing and DDT is reviewed for breakdown to DDE and DDD. Successful tuning must occur every 12 hours for method 8270C/D and every 24 hours for method 625, except where noted in the determinative SOP.

Following successful tuning, the GC/MS is calibrated using the internal standard procedure. A standard curve is prepared using a minimum of three standards for method 625 and five standards for method 8270C/D and SM6410B. The calibration standards are tabulated according to peak height or area against concentration and the concentrations and responses of the internal standard analytes. The results are used to determine a response factor for each analyte in each standard injected. A calibration curve is the constructed and is determined to be acceptable if each analyte meets the criteria specified in the determinative method. When this condition is met, linearity through the origin can be assumed and the average RF can be used in place of a calibration curve. Initial calibration that does not meet these requirements will not be accepted and recalibration must be performed. Linear regression can be used for target compounds exceeding the 15% criteria, providing that the correlation coefficient is 0.990 or better. USACE projects must meet a correlation coefficient of 0.995 or better. The initial calibration range must represent the typical environmental sample and include the RL as the lowest calibration point. The linear range of the instrument must be monitored to ensure that the maximum calibration point is within the range.

A second source calibration verification standard is analyzed after each calibration and should recover within 20% for all CCC compounds and within 50% for other analytes of interest for 8270C. All analytes must recover +/- 30% for 8270D. Following successful calibration, the analysis of field and QC samples may begin. Analysis may be performed only during the timeframe of a valid tuning cycle (12 hours for 8270C/D and 24 hours for 625). Following the expiration of the tuning clock, the instrument must be retuned and either re-calibrated or existing calibration may be re-verified.

For 8270C/D analyses, daily calibration verification includes successful demonstration of DFTPP sensitivity and the injection of a mid-level CCV standard containing all the target analytes of interest. The DFTPP tune must meet the ion abundance criteria specified within the published method. Each internal standard in the CCV must recover between -50% to + 100%, when compared to the same internal standard compound in the mid-point standard of the initial calibration curve. Additionally, if the retention time of an internal standard changes by more than 30 seconds from the retention time of the same internal standard in the mid-level standard of the most recent initial calibration, the system must be evaluated, corrected, and possibly re-calibrated.

For 625 analyses, daily calibration verification is accomplished by a successful demonstration of DFTPP sensitivity and the injection of a mid-level CCV standard containing all the target analytes of interest. The DFTPP tune must meet the same ion abundance criteria as the 8270C analysis and the CCV standard must recover within 20 % of predicted response for all analytes of interest.

8310, 610, SM6640B - PAHs by HPLC - SOP Number 330322

610: A standard curve is prepared using a minimum of three concentration levels for each compound of interest. If the response factors are < 10 % RSD over the working range, the average RF can be used for calculations

8310 & SM6640B: Perform calibration using a minimum of 5 points. If the response factors are < 20 % RSD over the working range, the average RF can be used for calculations or linear regression may be used providing that the correlation coefficient for each analyte of interest is 0.990 or better. USACE projects must meet a correlation coefficient of 0.995 or better. The regression line must never be forced through the origin.

The initial calibration standards are tabulated according to peak height or area responses against concentration for each compound and response factors are calculated. Alternatively, the results can be used to plot a calibration curve of response ratios (Area/Ref. Area) vs (Amt./Ref Amt.). The calibration range must represent the typical environmental sample and include the RL as the lowest calibration point. The linear range of the instrument must be monitored to ensure that the maximum calibration point is within the range. A second source calibration verification standard is analyzed after each calibration and should meet criteria of ±20%.

A continuing calibration verification (CCV) must be run at the beginning of each run and every 10 samples thereafter. The continuing calibration standard is prepared from the same source as the calibration curve and must perform within ±15% of the actual value. The CCV must represent the midpoint of the calibration range.

8330A/B/C – Nitroaromatics/Nitrosamines - SOP Number 330323

A standard curve is prepared using a minimum of five concentration levels for each compound of interest. Experience indicates that a linear calibration curve with zero intercept is appropriate for each analyte. Therefore, a response factor for each analyte can be taken as the slope of the best-fit regression line. The correlation coefficient for each analyte of interest is 0.990 or better. The calibration range must represent the typical environmental sample and include the RL as the lowest calibration point. The linear range of the instrument must be monitored to ensure that the maximum calibration point is within the range. A second source calibration verification standard is analyzed after each calibration and should meet the criteria of ±20%.

Daily calibration is accomplished through the analysis of midpoint calibration standards, at a minimum, at the beginning of the day, and singly after the last sample of the day (assuming a sample group of 10 samples or less). Obtain the response factor for each analyte from the mean peak heights or peak areas and compare it with the response factor obtained for the initial calibration. The mean response factor for the daily calibration must agree within ±20% of the response factor of the initial calibration. If this requirement is not met, a new initial calibration must be obtained.

8015B/C/D or State Specific Method - DRO/RRO - Various SOPs

Certain state accreditation/registration programs may have specific requirements for calibration and analysis that must be met. Those requirements supersede the general guidance provided in this section and are addressed in the determinative SOP. Generally, for 8015B/C/D analysis, the gas chromatograph is calibrated using the external standard procedure. A standard curve is prepared using a minimum of five concentration levels for each analyte of interest. The calibration range must represent the typical environmental sample concentration and include the RL as the lowest calibration point. The linear range of the instrument must also be monitored to ensure that the maximum calibration point is within detection range. The calibration standards are tabulated according to peak height or area responses against concentration for each compound and response factors are calculated. If the response factors of the initial calibration are ≤20 % RSD over the calibration range, or per state method, the average RF can be used for calculations. Alternatively, when the response factor criteria is exceeded, the analyst may utilize a linear calibration model of response ratios (i.e. Area/Ref. Area or Amt./Ref Amt.) for quantitation providing that the correlation coefficient is at least 0.990. USACE projects must meet a correlation coefficient of 0.995 or better.

During the analytical sequence, the stability of the initial calibration is verified following every 10th or 20th sample depending on method and at the end of the sequence by the analysis of a continuing calibration verification (CCV) standard. Typically, the CCV must recovery within 15% of the expected concentration for each analyte for method 8015B/C/D; however state specific limits for the CCV may vary. See the specific SOP or published method for more guidance. The concentration of the continuing check standard must be routinely varied to verify the entire calibration range.
At daily instrument startup and in lieu of performing an entire initial calibration, the most recent calibration curve may be verified by the analysis of check calibration verification standard (CCV). If the response for any analyte in this check varies from the predicted response by more than ±15% of the expected concentration for each analyte for method 8015B/C/D or more than state specified limits, the analysis must be repeated using fresh standard. If the standard still does not meet the criteria, a new initial calibration curve must be generated.

An independent, or second source, calibration verification standard (SSCV) is analyzed after each initial calibration and should meet criteria of ±20% of the expected concentration for each analyte. When sample responses exceed the range of the standard curve, the sample is diluted to a concentration suspected to be within the calibration range and re-analyzed.

8.5 ACCEPTANCE/REJECTION OF CALIBRATION

Organic Chemistry

The initial calibration curve is compared with previous curves for the same analyte. All new standard curves are immediately checked with a secondary source or laboratory control standard prepared from a separate source than those used for calibration. All curves are visually reviewed to ensure that acceptable correlation represents linearity. Calibration curves may be rejected for nonlinearity, abnormal sensitivity, or poor response of the laboratory control standard.

Continuing calibration verification is performed on each day that initial calibration is not performed and following every 10th or 20th sample. If a check standard does not perform within established criteria then the instrument undergoes an evaluation to determine the cause. Once the issue is corrected, all samples between the last in control standard and the first out of control check are re-analyzed.

TABLE 8.5: INSTRUMENT CALIBRATION

Instrument (Analysis)	Calibration Type	Minimum Number of Standards	Type of Curve	Acceptance/ Rejection Criteria	Frequency
Gas Chromatography	Initial	3 (600 series methods) - 5 (other) cal.stds	Avg. RF or Linear	8081A, 8151A, 6640C, 8141A, 657A: Must be ≤20% RSD 608 - ≤10% RSD	As needed
	Second Source	1 Second Source		+/- 20% of true value	With each calibration

TABLE 8.5: INSTRUMENT CALIBRATION

Instrument (Analysis)	Calibration Type	Minimum Number of Standards	Type of Curve	Acceptance/ Rejection Criteria	Frequency
(Pest/PCB, Herbicides, Organophos/ Organonitrogen Pesticides)	Daily / Continuing	OPPEST/HERB1/10 P/PCB 1/20		Must be within 15% of the initial calibration curve, 20% for 6640C.	Beginning, every 20 samples and ending for external cal.
	Daily / Continuing	OPPEST/HERB1/10 P/PCB 1/20		Must be within 15% of the initial calibration curve, 20% for 6640C.	Every 12hrs samples for internal cal
HPLC (PAH and Explosive)	Initial	3 (600 series methods) 5 (other) cal.stds	Avg. RF or Linear	8310, 8330: Must be ≤20% RSD 610 - ≤10% RSD	As needed
	Second Source	1 Second Source		+/- 20% of true value	With each calibration
	Daily / Continuing	1/10		Must be within 15% of the initial calibration curve.	Beginning, every 10 and ending.
GC/MS Semi-volatiles 8270C/D	Initial	At least 5 cal. stds	Avg. RF or Linear	8270C - Must be ≤15% RSD, CCCs must be ≤ 30% RSD, Linear regression: 0.990 per method or 0.995 for USACE	As needed
	Second Source	1 Second Source		8270D - Must be ≤20% RSD for target analytes, Linear regression: 0.990 per method or 0.995 for USACE	With each calibration
				8270C: Should recover within 20% for all CCC compounds and within 50% for other analytes of interest, with the exception of analytes known to perform poorly 8270D: Should recover w/in 30% for all	
	Daily / Continuing	Tune & CCV		Must pass established method criteria. See SOP.	Every 12 hours per method
GC/MS Semi-volatiles 625	Initial	3 cal.stds	Avg. RF or Linear	625 - ≤35% RSD all compounds	As needed
	Second Source	1 Second Source		Should recover within 20% for all CCC compounds and within 50% for other analytes of interest, with the exception of analytes known to perform poorly	With each calibration
	Daily / Continuing	Tune & CCV every 24 hours		Must pass established method tuning criteria; 625: CCV must be ≤20% difference for all compounds,	Every 24 hours
HAA 552.2	Initial	5 cal.stds	Avg. RF or Linear	≤30% RSD all compounds	As needed
	Second Source(QCS)	1 Second Source		±30% of true value	Extracted with each batch
	Daily / Continuing	1/10		CCV must be ≤30% difference for all compounds,	Beginning, every 10 and ending

RF or Linear	8015B/C/D - ≤20% RSD all compounds ±20% of true value CCV must be ≤15% difference for all compounds,	As needed With each calibration Beginning, every 10/20 and ending

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

Reagent grade water is obtained from an Evoqua resin with Aquafine UV system.

9.2 GLASSWARE WASHING AND STERILIZATION PROCEDURES

Organic laboratory glassware is washed in a non-phosphate detergent and warm tap water. Before washing, all writing and large deposits of grease are removed with acetone. Glassware is then rinsed with: tap water, "No Chromix" solution, tap water, and deionized (DI) water. It is then solvent rinsed in the following order: acetone, and then methylene chloride. Glassware is stored in designated drawers or on shelves, inverted if possible. All glassware is rinsed with the required solvent for the particular extraction protocol prior to use.

10.0 ANALYTICAL PROCEDURES

10.1 A list of laboratory SOPs associated with the semi-volatile laboratory can be found in the following table:

TABLE 10.1: SEMI-VOLATILE DEPARTMENT SOPS

11.0 QUALITY CONTROL CHECKS

NOTE: For specific guidance on each determinative method, including required quality control and specific state requirements/modifications, refer to the relevant laboratory standard operating procedure(s).

11.1 ESC participates in proficiency testing (PT's) in support of various laboratory accreditations/recognitions. Environmental samples are purchased from Environmental Resource Associates (ERA). The WS, WP and solid matrix studies are completed every 6 months. Proficiency testing samples are received and analyzed by method according to the vendor's instructions and according to the applicable analytical SOP.

11.2 Initial Demonstrations of Capability (IDOCs) are performed during new analyst training and/or prior to acceptance and use of any new method/instrumentation. Continuing

Demonstration of Capability (CDOCs) must be updated at least annually. The associated data is filed within the department and available for review.

11.3 Matrix Spike and Matrix Spike Duplicates are performed on each batch of samples analyzed depending on analytical method requested provided that sufficient volume is provided by the customer.

11.4 A Laboratory Control Sample (LCS) and LCS Duplicate are analyzed one per batch of samples.

11.5 A method preparation blank is performed per batch of samples processed. If the acceptance criteria as listed in the determinative SOP is exceeded, the laboratory shall evaluate whether re-processing of the samples is necessary, based on the following criteria:

- The blank contamination exceeds a concentration greater than 1/10 of the measured concentration of any sample in the associated preparation batch or
- The blank contamination is greater than 1/10 of the specified regulatory limit. The concentrations of common laboratory contaminants shall not exceed the reporting limit.

Any samples associated with a blank that fail these criteria shall be reprocessed in a subsequent preparation batch, except when the sample analysis resulted in non-detected results for the failing analytes.

12.0 DATA REDUCTION, VALIDATION AND REPORTING

12.1 DATA REDUCTION

The analyst performs the data calculation functions and is responsible for the initial examination of the finished data. Data reduction steps applied to the raw data are outlined in SOP #030201, *Data Handling and Reporting.* A secondary review of the data package is performed according to ESC SOP #030227, *Data Review*. The reviewer verifies that the analysis has been performed as required and meets method criteria, all associate data is present and complete, and also ensures that any additional documentation is completed as required (i.e. Ohio VAP checklists, required flags on test reports, etc.)

TABLE 12.1 Data Reduction Formulas

PARAMETER	FORMULA
GC and HPLC	response of sample analyte {*area*} x final extract volume {*mL*} x dilution response factor {*area/(mg/mL)*} x initial extract volume-mass {*mL or g*} *Calculations performed by HP Enviroquant Software*
GC/MS	response of analyte {*area*} x extract volume {*mL*} x dilution x int. std amt. {*area*} response factor {*area/(mg/mL)*} x initial volume-mass {*mL or g*} x int. std cal. {area} *Calculations performed by HP Enviroquant Software*

12.2 VALIDATION

The validation process consists of data generation, reduction review, and reporting results. Once data reduction is complete, validation is conducted by verification that the QC samples are within acceptable QC limits and that all documentation is complete, including the analytical report and associated QC. See Table 12.3 by method for current QC targets and controls and current reporting limits.

Marginal Excedence – When a large number of analytes exist in the LCS, it is statistically possible for a few analytes to be outside established control limits while the analytical system remains in control. These excursions must be random in nature and, if not, a review of the control limits or analytical process is necessary.

Upper and lower marginal excedence (ME) limits are established as the mean of at least 20 data points ± four times their standard deviations. The number of allowable marginal excedences per event is based on the number of analytes spiked in the LCS.

Allowable Marginal Exceedance per Event	
Analytes in LCS:	**ME Allowable**
>90	5
71-90	4
51-70	3
31-50	2
11-30	1
<11	0

Organic Control Limits - The organic QC targets are statutory in nature; warning and control limits for organic analyses are initially established for groups of compounds based on preliminary method validation data. When additional data becomes available, the QC targets are reviewed. All QC targets are routinely re-evaluated at least annually (and updated, if necessary) against laboratory historical data to insure that the limits continue to reflect realistic, method achievable goals.

12.3 REPORTING

Reporting procedures are documented in *SOP 030201 Data Handling and Reporting.*

13.0 CORRECTIVE ACTION

13.1 In the event that a nonconformance occurs in conjunction with the analytical batch, a corrective action response (CAR) form must be completed. The cause of the event is stated on the form and the measures taken to correct the nonconformance clearly defined. The effectiveness of the corrective action must be assessed and noted. The CAR is kept on file by the Regulatory Affairs Department. Corrective action procedures are documented in SOP #030208, *Corrective and Preventive Action*

13.2 Required Corrective Action

Control limits have been established for each type of analysis. When these limits are exceeded, corrective action must be taken. Calculated sample spike control limits are also used.

All samples and procedures are governed by ESCs quality assurance program. General corrective actions are as follows; however additional and more specific direction is provided in the specific determinative procedure. For more information, see the appropriate determinative SOP.

13.2.1 Laboratory QC Criteria and Appropriate Corrective Actions

If the analytical method contains acceptance/rejection criteria and it is more stringent than those controls generated by the laboratory the method criteria takes precedence.

13.2.2 Out Of Control Blanks: Applies to Method, Trip, Rinsate & Instrument Blanks

Rejection Criteria - Blank reading is more than twice the background absorbance or more than RL.

Corrective Action - Blanks are re-analyzed and the response is assessed. Standard curves and samples are evaluated for any obvious contamination that is isolated or uniform throughout the run. If necessary, reagents are re-prepared. Analyses are not initiated until the problem is identified and solved. If samples have already been prepared or analyzed, the Senior Chemist and/or Department Supervisor are consulted to determine if data needs to be rejected or if samples need to be re-prepared.

13.2.3 Out Of Control Laboratory Control Standards (LCS & LCSD)

Rejection Criteria - If the performance is outside of lab-generated control limits which are calculated as the mean of at least 20 data points $\pm$3 times the standard deviation of those points (Listed in Section 12) and the marginal excedence allowance is surpassed (see section 12.2).

Corrective Action - Instrument settings are checked and the LCS standard is reanalyzed. If the LCS is still out of control, instrumentation is checked for systemic problems and repaired (if necessary). Re-calibration is performed and the samples affected since the last in control reference standard are rerun. The Senior Chemist and/or Department Supervisor are consulted for further action.

13.2.4 Out Of Control Matrix Spike Samples

Rejection Criteria - If either the MS or MSD sample is outside the established control limits.

Corrective Action - Any compound that is outside of these limits is considered to be ‘out of control’ and must be qualified appropriately. Batch acceptance, however, is based on

method blank and LCS performance, not on MS/MSD recoveries. Specific methods, customers, and programs may require further corrective action in some cases.

13.2.5 Out Of Control Duplicate Samples

Rejection Criteria - Lab-generated maximum RPD limit (as listed under precision in Section 12)

Corrective Action - Any compound that is outside of these limits is considered to be 'out of control' and must be qualified appropriately. Batch acceptance, however, is based on method blank and LCS performance. Specific methods, customers, and programs may require further corrective action in some cases.

13.2.7 Out Of Control Calibration Standards: ICV, CCV, SSCV

Rejection Criteria - If the performance is outside of method requirements.

Corrective Action - Instrument settings are checked, calibration verification standard is reanalyzed. If the standard is still out of control, recalibration is performed, and samples affected since the last in control reference standard are rerun. The the Senior Chemist and/or Department Supervisor are consulted for further action.

14.0 RECORD KEEPING

Record keeping is outlined in SOP #030230, *Standards Logger, SOP #030227, Data Review* and SOP #030201, *Data Handling and Reporting.* Semi-Volatile organics calibration data are recorded and integrated using HP Enviroquant software. Calibration data from the semi-volatile analyses, in addition to the initial and daily calibration, includes GC/MS autotunes, DFTPP reports and surrogate recovery reports. Hard copy records of initial calibration and daily calibration are stored with chromatograms and integrated with sample data by date analyzed.

15.0 QUALITY AUDITS

System and data quality audits are outlined in the ESC Quality Assurance Manual Version 12.0 and *SOP #010104, Internal Audits*.

16.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix VII)	General – Replaced the term “client” with the term “customer” Table 8.1 – Updated Equipment List Table 10.1 – Updated SOP List Table 12.3 – Updated some RLs and added 1,4-Dioxane by Isotope Dilution

MT. JULIET, TENNESSEE 37122
(615) 758-5858

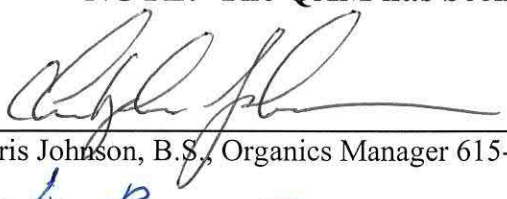
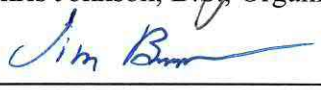
NOTE: The QAM has been approved by the following people.

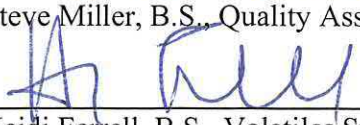


Chris Johnson, B.S., Organics Manager 615-773-9774



Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Director, 615-773-9684



Heidi Ferrell, B.S., Volatiles Supervisor, 615-773-9799

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This appendix discusses specific QA requirements for general analytical protocols to ensure that analytical data generated from the Air Laboratory are scientifically valid and are of acceptable quality. Any deviations from these requirements and any deviations that result in nonconforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and equipment, and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in *Section 4.0 in the ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

Heidi Ferrell, with a B.S. degree in Chemistry, is the Department Supervisor and is responsible for the overall production of the Air Laboratory; including the management of the staff and scheduling. Ms. Ferrell has 10 years of environmental laboratory experience.

In her absence, Matt Ferrell, with an A.S. of Applied Science, assumes responsibility for the Air Department decisions. Mr. Ferrell is the Primary Analyst for the Air Laboratory and is proficient in air analytical methods. He has 6 years of environmental laboratory experience.

5.2 TRAINING

The Supervisor trains new laboratory analysts according to ESC protocol. ESC's training program is outlined in *SOP 030205 Technical Training and Personnel Qualifications.* Performance is documented using an initial demonstration of capability (IDOCs) and continuing demonstration of capability (CDOC). On-going acceptable capability in Air Laboratory is also demonstrated by acceptable participation in the Phenova proficiency testing program (PTs). Documentation of analyst training is maintained on file within the department.

6.0 FACILITIES AND LABORATORY SAFETY

6.1 FACILITIES

The main area of the laboratory has approximately 670 square feet of area with roughly 150 square feet of bench area. There are 670 square feet of additional storage and the lighting is fluorescence. The air system is a ten-ton Trane split unit with natural gas for heating. The laboratory reagent water is provided through the US Filter deionizer system. Waste disposal containers are located in the laboratory and Clean Harbors serves as ESC's hazardous waste disposal company. ESC's building information guides and site plan are shown in Appendix I.

6.2 LABORATORY SAFETY

- Laboratory access is limited when work is being performed.
- All procedures where chemicals are prepared or splashes may occur are conducted in laboratory exhaust hoods.

ESC's laboratory safety guidelines are detailed in the *ESC Chemical Hygiene Plan.*

7.0 SAMPLING PROCEDURES

7.1 FIELD SAMPLING PROCEDURES, SAMPLE STORAGE, AND HANDLING

- Field Sampling procedures are described in Appendix III of this ESC Quality Assurance Manual. Sample information is recorded and kept on the ESC chain of custody and field logbooks.
- Samples for air analysis are collected in four ways:
  - Samples may be collected directly in evacuated Summa canisters fit with the appropriately adjusted regulators that control sampling flow to fill the canister over a given time period.
  - Summa canisters may also be collected as "grab" samples by simply opening the evacuated canister without the aid of a flow regulator and allowing the canister to fill quickly by virtue of the canister vacuum.
  - The third method entails collection of field samples using various sized bags specifically designed for air sampling (i.e. Tedlar). This type of sampling allows a pump connected via tubing to the bag's intake valve to sample the air at a controlled flow and over the appropriate timeframe needed by the customer.
  - The headspace of containers housing water samples may also be analyzed for specific volatile components.

- Air samples taken in summa canisters should be shipped in bubble wrapped boxes. Tedlar bags and water samples can be shipped in a container or cooler that is sufficiently rigid and protects the samples from damage that may be incurred in transport. The chain of custody is also placed in the container. The shipping label containing the name and address of the shipper is affixed to the outside of the shipment container.
- Samples are received in the laboratory login area and are tracked using LIMS (Laboratory Information Management System). A Chain of Custody Form accompanies all samples received by the lab. This is necessary to prove the traceability of the samples and to document the change in possession from sampling to delivery to receipt by the laboratory. Prior to analysis samples are checked for integrity. Sample handling, tracking and acceptance procedures are outlined in *SOP #060105, Sample Receiving.*

8.2 EQUIPMENT PREVENTIVE MAINTENANCE, EQUIPMENT CALIBRATION

INSTRUMENT	*P. M. DESCRIPTION*	*FREQUENCY*
Gas Chromatograph Detectors: FID	Change Quartz jet; clean; replace flame tip	As needed - when deterioration is noticeable
Gas Chromatograph/Mass Spectrometer	•Autotune Report	Inspected daily
Gas Chromatograph/Mass Spectrometer	•Clean ion source	As needed to maintain high mass resolution
Gas Chromatograph/Mass Spectrometer	•Replace vacuum pump oil	Every 6 months
Gas Chromatographs	•Replace column	When separation begins to degrade

8.3 STANDARDS AND REAGENTS

Table 8.3A: Standard stock sources, description and calibration information.
This table is subject to revision without notice

Method	Vendor	Description	Conc.	Storage Req.	Expiration
TO-15/SIM/8260B (VAP)/Method 8-mod. ISTD Stock Standard	Spectra Gases	ISTD and Tuning Mixture	1 ppmv	3395 L (2A) cylinder	1 year
TO-15/SIM/8260B (VAP)/Method 18-mod. Stock Standard*	Spectra Gases	Target Analytes	100 ppbv	3395 L (2A) cylinder	1 year
Landfill Gases Stock (CO_2, CO, CH_6, O_2, He)	Spectra Gases	Target Analytes	3 Levels	3395 L (2A) cylinder	1 year
Landfill Gases Laboratory Control Stock Standard	Spectra Gases	Target Analytes – Second Source	20%	3395 L (2A) cylinder	1 year
RSK-175 (Methane, Ethane, Ethene, Propane, Acetylene) Stock Standard	Scotty Gases	Target Analytes	1000 ppmv	3395 L (2A) cylinder	1 year
RSK-175 Laboratory Control Stock Standard	Scotty Gases	Target Analytes – Second Source	1000 ppmv	3395 L (2A) cylinder	1 year

TABLE 8.3B: Intermediate/Working Standard Concentrations *This table is subject to revision without notice*					
Organic Compounds	**Method #**	**Working Standard Concentrations**	**Volume of Stock Used**	**Final Volume**	**Expiration**
ISTD and Tuning Intermediate Standard	TO-15/8260B (VAP)/Method 18.	20 ppbv	1800 cc	15L in 15L Canister	1 year
Target Analytes* Intermediate Standard	TO-15/8260B (VAP)/Method 18	5 ppbv except Bromoform at 5ppbv, m&p Xylene at 10 ppbv and GRO at 200 ppbv	225 cc	15L in 15L Canister	1 year
TO-15/ 8260B(VAP)/ Method 18-mod. Laboratory Control* Intermediate Standard	TO-15/8260B (VAP)/Method 18	Second Source: 5 ppbv except Bromoform at 15ppbv, m&p Xylene at 10 ppbv and GRO at 200	225 cc	15L in 15L Canister	1 year
ISTD and Tuning Intermediate Standard	TO-15SIM	0.2ppbv	300 cc	15L in 15L Canister	1 year
Target Analytes	TO-15SIM	0.5ppbv	22.5 cc	15L in 15L Canister	1 year
TO-15SIM Laboratory Control* Intermediate Standard	TO-15SIM	0.5ppbv	22.5 cc	15L in 15L Canister	1 year

8.4 INSTRUMENT CALIBRATION

TO-15, 8260B (Ohio VAP Air), Gasoline Range Components (Method 18) – Volatiles in Air by GC/MS – SOP Numbers 330367, 330368, & 330369

Detector mass calibration is performed daily using the autotune function of the GC/MS analytical system and BFB (Bromofluorobenzene). Following verification of the appropriate masses, the instrument sensitivity is verified by injecting a tuning solution containing Bromofluorobenzene (BFB). The BFB must meet the following ion abundance criteria:

Mass	Ion Abundance Criteria
50	8.0-40.0% of mass 95
75	30.0-66.0% of mass 95
95	base peak, 100% relative abundance
96	5.0-9.0% of mass 95
173	< 2.0% of mass 174
174	50.0-120% of mass 95
175	4.0-9.0% of mass 174
176	> 93.0%, but less than 101% of mass 174

Mass	Ion Abundance Criteria
177	5.0-9.0% of mass 176

Successful tuning must occur every 24 hours for method TO-15, TO-15SIM and Method 18 and every 12 hours for method 8260B (OH VAP only).

Following successful tuning, the GC/MS is calibrated using the internal standard procedure. A standard curve is prepared using a minimum of five standards. The calibration standards are tabulated according to peak height or area against concentrations of the target analytes and the concentrations and responses of the internal standard analytes. The results are used to determine a response factor for each analyte in each standard injected.
A TO-15, TO-15SIM or Method 18 calibration curve is constructed and determined to be acceptable if each analyte is found to be constant over the working range (<30 % RSD with no more than 2 compounds being between 30 and 40 % RSD). When this condition is met, linearity through the origin can be assumed and the average RF can be used in place of a calibration curve.

When analyzing air by method 8260B, specific target analytes in the calibration standards are defined as calibration check compounds (CCCs) or system performance check compounds (SPCCs).

SPCCs:	
Analyte	Minimum Relative Response Factor
Chloromethane	0.10
1,1-Dichloroethane	0.10
Bromoform	0.10
Chlorobenzene	0.30
1,1,2,2-Tetrachloroethane	0.30

CCCs:	
1,1-Dichloroethene	Toluene
Chloroform	Ethylbenzene
1,2-Dichloropropane	Vinyl Chloride

Analytes identified by the method as SPCCs must meet the minimum average response factors listed above for successful initial calibration. Compounds identified as CCCs must have a %RSD of less than 30% in the initial calibration curve. The remaining target analytes in the calibration standards must be <15% RSD. Linear regression can be used for any target compound exceeding the 15% RSD criteria providing that the correlation coefficient is 0.990 or better. Initial 8260B calibration for the target analytes of interest for the customer project that do not meet these requirements are not accepted and re-calibration must be performed.

For all methods, the initial calibration range must represent the typical air sample and include the lowest standard at or below the RL. The linear range of the instrument must be monitored to ensure that the maximum calibration point is within the range. Following successful calibration, the analysis of field and QC samples may begin. Analysis may be performed only during the timeframe of a valid tuning cycle (12 hours for 8260B and 24 hours for TO-15, TO-15SIM and Method 18). Following the expiration of the tuning clock, the instrument must be re-tuned and either recalibrated or the existing calibration may be verified prior to further sample analysis.

For 8260B analyses, daily continuing calibration verification (CCV) includes successful demonstration of BFB sensitivity and the injection of a mid-level CCV standard containing all the target analytes of interest, the CCC, and SPCC compounds. The BFB tune must meet the ion abundance criteria (see table above). Each SPCC in the calibration verification standard must meet a minimum response factors listed above. The CCCs must achieve the criteria of +/- 20% RSD. Each internal standard in the CCV must recover between -50% to + 100%, when compared to the same internal standard compound in the mid-point standard of the initial calibration curve. Additionally, if the retention time of an internal standard changes by more than 30 seconds from the retention time of the same internal standard in the mid-level standard of the most recent initial calibration, the system must be evaluated, corrected, and possibly re-calibrated.

For TO-15,TO-15SIM and Method 18 analyses, daily calibration verification is accomplished by a successful demonstration of BFB sensitivity and the injection of a mid-level CCV standard containing all the target analytes of interest. The BFB tune must meet the same ion abundance criteria as previously listed and the CCV standard must recover within 30% of predicted response for all analytes of interest.

Fixed Gases (Carbon Dioxide, Carbon Monoxide, Methane, Oxygen) based on ASTM D1946 – SOP Number 330372

Optimize the conditions of the Gas Chromatograph with Thermal Conductivity Detection according to the manufacturer's specification to provide good resolution and sensitivity. Verify that the gas flows and column and detector temperatures are at optimum levels for analysis, based on peak resolution and chromatograph performance. Allow sufficient time between each temperature adjustment to attain a stable reading (typically one hour). Standards are injected at a minimum of five concentration levels from purchased certified standards. Generation of the initial calibration is performed using PC-based D.01 ChemStation software and a calibration factor or linear regression model. The calibration must meet 15% RSD for calibration factors or a correlation coefficient of at least 0.990. Instrument calibration must be verified initially on days when a full calibration curve is not analyzed, following every 10 injections during the analytical sequence, and at the end of each sequence by the analysis of a check standard. These standards must recover within 15% of the expected concentration.

Methane, Ethane, Ethene, Propane, Acetylene based on RSK-175 – SOP Number 330370

Optimize the conditions of the Gas Chromatograph with Thermal Conductivity Detection according to the manufacturer's specification to provide good resolution and sensitivity. Verify that the gas flows and column and detector temperatures are at optimum levels for analysis, based on peak resolution and chromatograph performance. Allow sufficient time between each temperature adjustment to attain a stable reading (typically one hour). Standards are injected at a minimum of five concentration levels. The target analytes in the calibration standards must be ≤15% RSD. Linear regression can be used for any target compound exceeding the 15% RSD criteria providing that the correlation coefficient is 0.990 or better. Headspace is created in each field sample by forcing 20cc of helium into each sample vial. Following sufficient time for the sample and headspace to reach equilibrium, 100uL of air is removed from each vial and injected into the GC. Instrument calibration must be verified initially on days when a full calibration curve is not analyzed, following every 10 injections during the analytical sequence, and at the end of each sequence by the analysis of a check standard. These standards must recover within 15% of the expected concentration.

Methanol and Ethanol (MEETAC) in soil and water samples based on EPA 8260B/C – SOP Number 330373

Detector mass calibration is performed daily using the autotune function of the GC/MS analytical system and BFB (Bromofluorobenzene). Following verification of the appropriate masses, the instrument sensitivity is verified by injecting a tuning solution containing Bromofluorobenzene (BFB). The BFB must meet the following ion abundance criteria:

Mass	Ion Abundance Criteria
50	15.0-40.0% of mass 95
75	30.0-60.0% of mass 95
95	base peak, 100% relative abundance
96	5.0-9.0% of mass 95
173	< 2.0% of mass 174
174	> 50.0% of mass 95
175	5.0-9.0% of mass 174
176	> 95.0%, but less than 101% of mass 174
177	5.0-9.0% of mass 176

Successful tuning must occur every 12 hours.

Following successful tuning, the GC/MS is calibrated using the external standard procedure. A standard curve is prepared using a minimum of five standards. The calibration standards are tabulated according to peak height or area against concentrations of the target analytes. The results are used to determine a response factor for each analyte in each standard injected. A calibration curve is constructed and determined to be acceptable if each analyte is found to be constant over the working range (<15 % RSD). When this condition is met, linearity through the origin can be assumed and the average CF can be used in place of a calibration curve. Linear regression can be used for any target compound exceeding the 15% RSD criteria providing that the correlation coefficient is 0.990 or better.

The initial calibration range must represent the typical field sample and include the lowest standard at or below the RL. The linear range of the instrument must be monitored to ensure that the maximum calibration point is within the range. Following successful calibration, the analysis of field and QC samples may begin. Analysis may be performed only during the timeframe of a valid tuning cycle (12 hours). Following the expiration of the tuning clock, the instrument must be re-tuned and either recalibrated or the existing calibration may be verified prior to further sample analysis.

Daily calibration verification is accomplished by a successful demonstration of BFB sensitivity and the injection of a mid-level CCV standard containing all the target analytes of interest. The BFB tune must meet the same ion abundance criteria as previously listed and the CCV standard must recover within 15% of predicted response for all analytes of interest.

8.5 ACCEPTANCE/REJECTION OF CALIBRATION

The initial calibration curve is compared with previous curves for the same analyte. All new standard curves are immediately checked with a secondary source or laboratory control standard prepared from a separate source than those used for calibration. All curves are visually reviewed to ensure that acceptable correlation represents linearity. Calibration curves may be rejected for nonlinearity, abnormal sensitivity, or poor response of the laboratory control standard.

Continuing calibration verification is performed on each day that initial calibration is not performed and following every tenth sample. If a check standard does not perform within established criteria then the instrument will undergo evaluation to determine the problem. Once the problem is corrected, all samples between the last in control sample and the first out of control check will be re-analyzed.

TABLE 8.5: INSTRUMENT CALIBRATION & QC

Analysis/ Instrument	Calibration Type	Number of Standards	Acceptance/ Rejection Criteria	Frequency
TO-15/SIM & Method 18/ GC/MS	Initial/ Continuing	1 - Tuning Solution	Mass m/z Abundance Criteria 50 8-40% of mass 95 75 30-66% of mass 95 95 Base peak, 100% 96 5-9% of mass 95 173 <2% of mass 174 174 50-120% of mass 95 175 4-9% of mass 174 176 >93% but <101% of mass 174 177 5-9% of mass 176	TO-15/SIM/ M-18: Every 24 hours 8260 VAP: Every 12 hours
TO-15/SIM & Method 18/ GC/MS	Initial	5 minimum	Average Response Factor: <30 % RSD with no more than 2 compounds being between 30 and 40 % RSD	As needed
8260B VAP/ GC/MS	Initial	5 minimum	Average Response Factor: Target analytes in the calibration standards must be <15% RSD, CCCs must have a %RSD of less than 30% & SPCCs must meet the minimum average response factors. Linear regression can be used for any target compound exceeding the 15% RSD	As needed
TO-15/SIM & Method 18/ GC/MS	Continuing	1 cal. check verification (CCV)	Percent Difference for all compounds <30%	Daily, when init. calibration is not required.
TO-15 VAP/ GC/MS	Continuing	1 cal. check verification (CCV)	Average Response Factor: Target analytes in the calibration standards must be <15% RSD, CCCs must have a %RSD of less than 20% & SPCCs must meet the minimum average response factors.	Daily, when init. calibration is not required.
TO-15/SIM & Method 18	Initial/ Continuing	1 - Blank	< RL, concentrations of common laboratory contaminants shall not exceed the reporting limit	Following init. calibration or daily cal. verification
TO-15/SIM & Method 18	Initial/ Continuing	2 – (LCS/LCSD)	Must be within +/-30% with an RPD of <25.	Following initial calibration or daily cal. Verification
Landfill Gas/Helium	Initial	3	Average Response Factor: Target analytes in the calibration standards must be <15% RSD. Linear regression can be used for any target compound exceeding the 15% RSD	As needed
Landfill Gas/Helium	Continuing	1 - cal. check verification (CCV)	Target analytes in the calibration standards must be <15% RSD.	Daily, when init. calibration is not required, following every 10th injection, and the end of the sequence.

TABLE 8.5: INSTRUMENT CALIBRATION & QC

Analysis/ Instrument	Calibration Type	Number of Standards	Acceptance/ Rejection Criteria	Frequency
Landfill Gas/Helium	Initial/ Continuing	1 - Blank	< RL, concentrations of common laboratory contaminants shall not exceed the reporting limit	Following init. calibration or daily cal. verification
Landfill Gas/Helium	Initial/ Continuing	2 – Second source (LCS/LCSD)	Must be within +/-30% with an RPD of <25.	Following initial calibration or daily cal. verification
RSK-175	Initial	3	Average Response Factor: Target analytes in the calibration standards must be <15% RSD. Linear regression can be used for any target compound exceeding the 15% RSD	As needed
RSK-175	Continuing	1 - cal. check verification (CCV)	Target analytes in the calibration standards must be <15% RSD.	Daily, when init. calibration is not required, following every 10th injection, and the end of the sequence.
RSK-175	Initial/ Continuing	1 - Blank	< RL, concentrations of common laboratory contaminants shall not exceed the reporting limit	Following init. calibration or daily cal. verification
RSK-175	Initial/ Continuing	2 – Second source (LCS/LCSD)	Must be within +/-30% with an RPD of <25.	Following initial calibration or daily cal. verification
MEETAC	Initial/ Continuing	1 - Tuning Solution	Mass m/z Abundance Criteria 50 15.0-40.0% of mass 95 75 30.0-60.0% of mass 95 95 base peak, 100% relative abundance 96 5.0-9.0% of mass 95 173 < 2.0% of mass 174 174 > 50.0% of mass 95 175 5.0-9.0% of mass 174 176 > 95.0%, but less than 101% of mass 174 177 5.0-9.0% of mass 176	Every 12 hours
MEETAC	Initial	5 minimum	Average Response Factor: Target analytes in the calibration standards must be <15% RSD,	As needed
MEETAC	Continuing	1 cal. check verification (CCV)	Average Response Factor: Target analytes in the calibration standards must be <15% RSD,	Daily, when init. calibration is not required.
MEETAC	Initial/ Continuing	1 - Blank	< RL, concentrations of common laboratory contaminants shall not exceed the reporting limit	Following init. calibration or daily cal. verification

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

Reagent Grade water –Type II used in the Air Laboratory is generated in the Microbiology Laboratory and is periodically checked for contamination. Type II water is checked annually for single and total heavy metals. Monthly checks for total organic carbon, ammonia and organic nitrogen, total residual chlorine and a heterotrophic plate count are also conducted. Conductivity and pH are checked continuously or with each use.

9.2 SAMPLER CLEANING AND CERTIFICATION PROCEDURE

Canisters are cleaned in the laboratory using the Entech 3100 4-Position Canister Cleaner. Canisters are cleaned in batches of 4 to 8 per cleaning cycle. Prior to cleaning, canisters are inspected for integrity, damage and visible contamination. Acceptable canisters are connected to the manifold on the Entech cleaner and the cleaning cycle is controlled using Entech SmartLab software. Programmable cleaning cycles include: light, medium and heavy-duty and the cycle selected depends on the previous use of the dirtiest canister being cleaned. The cleaner automatically performs a leak check for the canisters and the manifold prior to the initial evacuation cycle. Heating bands are placed on each canister to elevate the temperature of the metallic canister to a level that provides for efficient cleaning. The typical cleaning cycle parameters are:

	Operating temperature = 120°C
1	Initial evacuation of canister to 1000 mtorr
2	Refill canister to 20psi
3	Evacuate the canister to 1000 mtorr
4	Repeat items 2 & 3 for a minimum of 8 cycles
5	Final zero air pressure in clean canister is 50 mtorr.

Following cleaning, a single canister is selected as a QC sample for the entire batch and the sample is filled with zero air or nitrogen and analyzed to verify that successful cleaning has occurred. If the analysis indicates that the batch is clean (i.e. <0.2 ppbv for target analytes and free of additional contamination), the QC sample is returned to the cleaner manifold. The entire batch is evacuated to less than 50 mtorr and clearly labeled as clean and ready for sample collection. If the QC sample indicates that canister contamination is still present, the batch is recycled through the cleaning process until residual contamination is no longer present. If following repeated cleaning cycles, residual contamination is still observed, canisters may be permanently removed from service and clearly identified as unusable.

Tedlar bags and vials, as used for headspace analyses, are purchased as certified pre-cleaned from approved providers and disposed of following the sample retention period.

9.3 TYPICAL ENTECH AUTOSAMPLER OPERATING PARAMETERS

These parameters are provided as an example and may be modified to improve analytical system performance or better address project needs.

Line Temp = 100°C	Module 2 Desorb = 180°C
Bulk Head 1 = 30°C	Module 2 Bake = 190°C
Bulk Head 2 = 30°C	Module 2 Desorb Time = 3.5 min
Module 1 Trap = -150°C	Module 3 Trap = -180°C
Module 1 Preheat = 20°C	Module 3 Inject = 2 min
Module 1 Desorb = 20°C	Module 3 Bake Time = 2 min
Module 1 Bake = 130°C	Module 3 Event = 3
Module 1 Bake Time = 5 min	Module 3 Wait Time = 25 min.
Module 2 Trap = -30°C	Pressure Comp Factor = 14
Module 2 Preheat = off	Loop Flush = 30 seconds

10.0 ANALYTICAL PROCEDURES

10.1 A list of laboratory SOPs associated with the air laboratory can be found in the following table:

TABLE 10.1: AIR DEPARTMENT SOPs

This Table is subject to revision without notice

SOP #	Title/Description
330367	Measurement of Volatile Organic Compound in Ambient Air by GC/MS (EPA TO-15)
330367OH	Measurement of Volatile Organic Compound in Ambient Air by GC/MS (EPA TO-15) (Ohio VAP only)
330368	Gasoline Range Organics in Ambient Air by GC/MS – Method 18 Modified
330370	Method for Determination of Methane, Ethane, and Ethene (Based on RSK-175)
330371	Canister Cleaning, Certification and Storage
330371OH	Canister Cleaning (Ohio Vap Only)
330372	The Analysis of Fixed Gases using GC/TCD
330373	Meetac – Methanol and Ethanol Based on EPA 8260B/C

10.2 Sample Dilutions:

Dilutions for air samples from summa canisters and Tedlar bags may take three forms depending on the level of dilution required. These dilution techniques are demonstrated below:

Autosampler Dilution:

- First, a smaller sample volume can be analyzed using the capabilities of the Entech autosampler. For example, for a standard sample volume of 400cc, if 40cc were analyzed, that would be equivalent to a 10-fold dilution.
- The smallest sample volume that can be accurately analyzed using the autosampler method is l0cc (or a 40x).

Pressurized Manual Dilution:

- Sometimes, a 40X dilution is not sufficient to bring the concentration of a target analyte within the calibration range. In those cases, the sample canister is pressurized resulting in a dilution of the target analytes present.
- The act of introducing more pure air into the canister performs a dilution.
- The canister can then be analyzed at 400cc or diluted using a lesser autosampler volume, if necessary.

Secondary Manual Dilution:

- In extreme cases, the canister may need to be diluted into a second evacuated canister.
- This is accomplished by using a gas tight syringe to remove an aliquot of sample (1-l0mL) from the initial canister then injecting it into a clean evacuated second canister.
- The second canister is then analyzed and quantified taking into account the dilution based on the amount of sample injected and the total volume of the canister utilized.

Tedlar Bag Dilutions:

- Dilutions on Tedlar bags can be performed in much the same manner as summa canisters using either the autosampler dilution or the secondary manual dilution using a second Tedlar bag and filling it with pure air then adding an aliquot of field sample using a gas tight syringe.

11.0 QUALITY CONTROL CHECKS

NOTE: For specific guidance on each determinative method, including required quality control and specific state requirements/modifications, refer to the relevant laboratory standard operating procedure(s).

11.1 Initial Demonstrations of Capability (IDOCs) are performed during new analyst training and/or prior to acceptance and use of any new method/instrumentation. Continuing Demonstration of Capability (CDOCs) must be updated at least annually for each analyst performing testing on field samples. The associated data is filed within the department and available for review.

11.2 A Laboratory Control Sample (LCS) and LCS Duplicate are analyzed per batch of samples and must yield recoveries within 70-130% of the expected concentration for all analytes and this pair must not exceed and RPD of 25%. Analytes specifically listed in each SOP as poor performers must yield recoveries as listed in each determinative SOP. LCS stock standards are prepared from sources independent of the calibration standards and also serve to verify the original calibration curve.

11.3 A method preparation blank is performed per batch of samples processed. If the acceptance criteria as listed in the determinative SOP is exceeded, the laboratory shall evaluate whether reprocessing of the samples is necessary, based on the following criteria:

- The blank contamination exceeds a concentration greater than 1/10 of the measured concentration of any sample in the associated preparation batch or
- The blank contamination is greater than 1/10 of the specified regulatory limit. The concentrations of common laboratory contaminants shall not exceed the reporting limit.

Any samples associated with a blank that fail these criteria shall be reprocessed in a subsequent preparation batch, except when the sample analysis resulted in non-detected results for the failing analytes.

12.0 DATA REDUCTION, VALIDATION AND REPORTING

12.1 DATA REDUCTION

The analyst performs the data calculation functions and is responsible for the initial examination of the finished data. Data reduction steps applied to the raw data are outlined in SOP #030201, *Data Handling and Reporting.* A secondary review of the data package is performed according to ESC SOP #030227, *Data Review*. The reviewer verifies that the analysis has been performed as required and meets method criteria, all associate data is present and complete, and also ensures that any additional documentation is completed as required (i.e. Ohio VAP checklists, required qualifiers on test reports, etc.)

TABLE 12.1 Data Reduction Formulas

PARAMETER	FORMULA
GC/MS – Analyte Response Factor	response of analyte primary ion {*area*} x concentration of analyte (ug/L) response of ISTD primary ion {*area*} x concentration of ISTD (ug/L) *Calculations performed by HP Enviroquant Software*
GC/MS – Sample Analyte Concentration	response of primary ion in analyte x int. std concentration. {*ppbv*} x dilution factor response factor {*area/(mg/ml)*} x initial volume-mass {*ml or g*} x int. std cal. {area} *Calculations performed by HP Enviroquant Software*

12.2 VALIDATION

The validation process consists of data generation, reduction review, and reporting results. Once data reduction is complete, validation is conducted by verification that the QC samples are within acceptable QC limits and that all documentation is complete, including the analytical report and associated QC. See Table 12.3 by method for current QC targets and controls and current reporting limits.

Organic Control Limits **-** The organic QC targets are statutory in nature; warning and control limits for organic analyses are initially established for groups of compounds based on preliminary method validation data. When additional data becomes available, the QC targets are reviewed. All QC targets are routinely re-evaluated at least annually (and updated, if necessary) against laboratory historical data to insure that the limits continue to reflect realistic, method achievable goals.

12.3 REPORTING

Reporting procedures are documented in SOP #030201, *Data Handling and Reporting.*

Table 12.3: QC Targets for Air Accuracy (LCS), Precision and RLs
This table is subject to revision without notice

Analyte	Method	Matrix	Accuracy (%)	Prec. (% RPD)	RL	Unit
1,1,1-Trichloroethane	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,1,2,2-Tetrachloroethane	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,1,2-Trichloroethane	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,1-Dichloroethane	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,1-Dichloroethene	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,2,4-Trichlorobenzene	TO-15	Air	53.6-154	25.0	0.63	ppbv
1,2,4-Trimethylbenzene	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,2-Dibromoethane	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,2-Dichlorobenzene	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,2-Dichloroethane	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,2-Dichloropropane	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,3,5-Trimethylbenzene	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,3-Butadiene	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,3-Dichlorobenzene	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,4-Dichlorobenzene	TO-15	Air	70.0-130	25.0	0.2	ppbv
1,4-Dioxane	TO-15	Air	48.0-156	25.0	0.2	ppbv
1,1,1-Trichloroethane	TO-15	Air	70.0-130	25.0	0.2	ppbv
2,2,4-Trimethylpentane	TO-15	Air	70.0-130	25.0	0.2	ppbv
2-Chlorotoluene	TO-15	Air	70.0-130	25.0	0.2	ppbv

Table 12.3: QC Targets for Air Accuracy (LCS), Precision and RLs
This table is subject to revision without notice

Analyte	Method	Matrix	Accuracy (%)	Prec. (% RPD)	RL	Unit

Methane	RSK-175	Air/ Headspace	85.0-115	20.0	0.01	ppmv
Ethane	RSK-175	Air/ Headspace	85.0-115	20.0	0.0129	ppbmv
Ethene	RSK-175	Air/ Headspace	85.0-115	20.0	0.0127	ppmv
Propane	RSK-175	Air/ Headspace	85.0-115	20.0	0.0186	ppmv
Acetylene	RSK-175	Air/ Headspace	85.0-115	20.0	0.0208	ppmv
Carbon Dioxide	ASTM D1946	Air	70.0-130	20.0	0.50 / 200	% / ppmv
Carbon Monoxide	ASTM D1946	Air	70.0-130	20.0	0.50 / 200	% / ppmv
Methane	ASTM D1946	Air	70.0-130	20.0	0.50 / 200	% / ppmv
Nitrogen	ASTM D1946	Air	70.0-130	20.0	0.50 / 200	% / ppmv
Oxygen	ASTM D1946	Air	70.0-130	20.0	0.50 / 200	% / ppmv
Helium	ASTM D1946	Air	70.0-130	25.0	100	ppmv
Methanol	MEETAC	Water/Soil	70.0-130	20.0	20.0/100	ppb / ppm
Ethanol	MEETAC	Water/Soil	70.0-130	20.0	20.0/100	ppb / ppm

13.0 CORRECTIVE ACTION

13.1 In the event that a nonconformance occurs in conjunction with the analytical batch, a corrective action response (CAR) form must be completed. The cause of the event is stated on the form and the measures taken to correct the nonconformance clearly defined. The effectiveness of the corrective action must be assessed and noted. The CARs are kept on file by the Regulatory Affairs Department. Corrective action procedures are documented in SOP #030208, *Corrective and Preventive Action*

13.2 Required Corrective Action

Control limits have been established for each type of analysis. When these limits are exceeded, corrective action must be taken. Calculated sample spike control limits are also used.

All samples and procedures are governed by ESC's quality assurance program. General corrective actions are as follows; however additional and more specific direction is provided in the specific determinative procedure. For more information, see the appropriate determinative SOP

13.2.1 Laboratory QC Criteria and Appropriate Corrective Actions

If the analytical method contains acceptance/rejection criteria and it is more stringent than those controls generated by the laboratory, the method criteria takes precedence.

13.2.2 Calibration Verification Criteria Are Not Met.

Rejection Criteria – See Table 8.5.

Corrective Action – Instrument settings are checked. The standard is reviewed for obvious cause. The standard may require re-analysis or the instrument may require recalibration.

13.2.3 Out Of Control Blanks:

Rejection Criteria - Blank reading is more than ½ the RL.

Corrective Action - Instrument settings are checked. The Blank is re-analyzed. If the blank is still out of control, bakeout of the system is performed and the blank is re-analyzed.

13.2.4 Out Of Control Laboratory Control Standards (LCS)

Rejection Criteria - If the performance is outside of lab-generated control (Listed in Table 12.3).

Corrective Action - Instrument settings are checked. The LCS standard is re-analyzed. If the LCS is still out of control, re-calibration is performed, and samples affected since the last in control reference standard are re-analyzed.

14.0 RECORD KEEPING

Record keeping is outlined in SOP #030230, *Standards Logger, SOP #030227, Data Review* and SOP #030201, *Data Handling and Reporting*

15.0 QUALITY AUDITS

System and data quality audits are outlined in the ESC Quality Assurance Manual Version 13.0 and in *SOP #010104, Internal Audits*.

16.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix VIII)	General – Replaced the term “client” with the term “customer” and added TO-15SIM Table 8.1 – Updated Equipment List Tables 8.3A and 8.3B – Updated standards Table 10.1 – Updated SOP List

Aquatic Toxicity Laboratory
QUALITY ASSURANCE MANUAL

APPENDIX IX TO THE ESC
QUALITY ASSURANCE MANUAL

for

ESC LAB SCIENCES
12065 LEBANON ROAD
MT. JULIET, TENNESSEE 37122
(615) 758-5858

Prepared by

ESC LAB SCIENCES
12065 LEBANON ROAD
MT. JULIET, TENNESSEE 37122
(615) 758-5858

NOTE: The QAM has been approved by the following people.

Eric Johnson, B.S., Director of Operations 615-773-9654

Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Director, 615-773-9684

Christabel Fernandes-Monteiro, PhD., Biology Department Manager, 615-773-9683

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This appendix discusses specific QA requirements for general analytical protocols to ensure that analytical data generated from the Aquatic Toxicity laboratory are scientifically valid and are of acceptable quality. Any deviations from these requirements and any deviations that result in non-conforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and materials and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in *Section 4.0 in the ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

Dr. Christabel Fernandes-Monteiro, with a Ph.D. in Applied Biology, is the Department Manager of Biology. She oversees supervision of laboratory operations in the Mold, Aquatic Toxicity, Microbiology, Protozoan and BOD laboratories. Her responsibilities include assurance of reliable data through monitoring of quality control, corroborating the analysis performed, protocol development, coordination with customers regarding sample analysis, scheduling of tests and overall production in all sections within the Biology Laboratory, including management of staff. In her absence, Shain Schmitt assumes her responsibilities in the Aquatic Toxicity laboratory.

Shain Schmitt with a B.S. degree in Conservation Biology, is the Primary Analyst for the Aquatic Toxicity laboratory. Mr. Schmitt is proficient in aquatic toxicity analytical methods and is responsible for sample analysis, review and approval of data associated with toxicity analyses. His responsibilities also include the coordination with customers regarding sample analysis, scheduling, data reductions, interpretation and validation of toxicity testing. In his absence, Brandon Etheridge assumes his responsibilities.

5.2 TRAINING

All new analysts to the laboratory are trained by the Primary Analyst or Manager according to ESC protocol. ESC's training program is outlined in *SOP 350355 Technical Training and Personnel Qualification for Biology–Aquatic Toxicity.* Performance is documented using an initial demonstration of capability (IDOCs) and continuing demonstration of capability (CDOC). On-going acceptable capability in toxicity analysis is also demonstrated by acceptable participation in the Phenova proficiency testing

program (PTs) as well as by performing routine reference toxicant testing at the same concentrations and in the same dilution water as is used for field sample testing. Documentation of analyst training is maintained on file within the department.

6.0 FACILITIES AND LABORATORY SAFETY

6.1 FACILITIES

The main area of the laboratory has approximately 1440 square feet of area with roughly 280 square feet of bench area. There are 300 square feet of additional storage and the lighting is fluorescence. The air system is a five-ton Trane split unit with natural gas for heating. The laboratory reagent water is provided through the Siemans Elga UltraPure deionizer system. Biohazard containers are located in the laboratory and Stericycle Waste Removal serves as ESC's biological waste disposal contractor. ESC's building information guides and site plan are shown in Appendix I.

6.2 LABORATORY SAFETY

- Laboratory access is limited when work is being performed.
- The following Biosafety Level 2 (BSL2) guidelines are adhered to:
  - Closed-toe shoes are worn in the laboratory
  - Floors and work surfaces are cleaned on a regular basis
  - Emergency numbers are posted in the laboratory
  - Laboratory personnel are trained in the use of the biological spill kit and emergency safety equipment
- ESC's laboratory safety guidelines are detailed in the ESC *Chemical Hygiene Plan*.

7.0 SAMPLING PROCEDURES

7.1 FIELD SAMPLING PROCEDURES, SAMPLE STORAGE, AND HANDLING

- Field Sampling procedures are described in Appendix III of this ESC Quality Assurance Manual. Sample information is recorded and kept on the ESC chain of custody and field logbooks.
- Samples are received in the laboratory login area and are tracked using LIMS (Laboratory Information Management System). A Chain of Custody Form accompanies all samples and can be viewed in LIMS. This is necessary to prove the traceability of the samples and to document the change in possession from sampling to delivery to receipt by the laboratory. Prior to analysis samples are checked for integrity. Once samples are checked to confirm integrity, the samples are logged with unique sample identification information and a label is affixed to each container. Chronic Toxicity samples are uniquely identified with "sample 1, sample 2 and sample 3". A sample custodian then transports samples to the laboratory. Sample handling and tracking procedures are outlined in *SOP 060105, Sample Receiving.*

- Samples for Chronic and Acute toxicity testing are collected in either 1 Gal HDPE or glass containers with no preservative and 125 ml HDPE without preservative for Alkalinity and with preservative for Hardness. Holding time is 36 hours between collection and first use of sample and last use of sample for renewal shall not exceed 72 hours without permission from permitting authority.
- Requirements for sample acceptance are located in *SOP 060105, Sample Receiving.* At a minimum, the following physical and chemical parameters are analyzed for each sample received:

  - Temperature
  - pH - initial and final measurements recorded
  - D.O. - initial and final measurements recorded
  - Specific Conductance
  - Alkalinity
  - Hardness
  - Total Residual Chlorine
- Samples must be immediately cooled and maintained at 0-6^{o}C following sampling, during shipment and prior to testing.

Residual Chlorine Treatment

- Residual chlorine in biomonitoring samples is monitored using a pocket colorimeter and these checks are documented. Chlorine removal is not performed on submitted field samples.

Dissolved Oxygen

For acute tests, samples that are $\leq$ 4.0mg/L are aerated until the sample reaches 90% saturation. For chronic tests, samples that are $\leq$ 5.0 mg/L are aerated until the sample reaches 90% saturation.

8.0 EQUIPMENT

8.1 EQUIPMENT LIST

TABLE 8.1 – LABORATORY EQUIPMENT LIST: MAJOR ITEMS – Aquatic Toxicity Lab
This table is subject to revision without notice.

Item	*Manufacturer*	*Model*	*Location*
Analytical Balance	Mettler	AT261 Delta Range	Aquatic Tox Lab
Class "I" weights (2)	Troemner		Aquatic Tox Lab
Conductivity Meter	Orion	150 A+	Aquatic Tox Lab
Dissolved Oxygen Meter	YSI	Model 50	Aquatic Tox Lab
Stereoscope	Olympus	SZX-IllK100	Aquatic Tox Lab
Oven (1)	Fisher	655F	Aquatic Tox Lab
Incubator	Thermo-Kool	Environmental chamber	Aquatic Tox Lab

TABLE 8.1 – LABORATORY EQUIPMENT LIST: MAJOR ITEMS – Aquatic Toxicity Lab *This table is subject to revision without notice.*			
Item	***Manufacturer***	***Model***	***Location***
Incubator	Percival Scientific	1-37 VL	Aquatic Tox Lab
Incubator	Precision Sci.	818	Aquatic Tox Lab
Incubator (2)	Precision Sci.	818	Aquatic Tox Lab

Stereoscope	Olympus	SZH-STS	Aquatic Tox Lab
Freezer	Kenmore	198.813.582	Aquatic Tox Lab

8.2 EQUIPMENT PREVENTIVE MAINTENANCE, EQUIPMENT CALIBRATION

PREVENTATIVE MAINTENANCE FOR LABORATORY EQUIPMENT		
INSTRUMENT	***P. M. DESCRIPTION***	***FREQUENCY***
Analytical Balances	•Check with Class "I" weights	Daily-tolerance 1 gm - ±0.0001 gm
Analytical Balances	•Service/Calibration (semiannual contract maintenance and calibration check)	10 gm - ±0.01 gm
Analytical Balances	•Service/Calibration (semiannual contract maintenance and calibration check)	Semi-annually
Refrigerators & Incubators	•Maintenance service	As needed - determined by twice daily temperature performance checks @ least 4 hours apart
Dissolved oxygen meter	•Calibrate with each use	Daily
Dissolved oxygen meter	•Change probe membrane	Every two to four weeks when in use
Conductivity Meter	•Check probe cables	As needed
Conductivity Meter	•Clean probe	As needed
Conductivity Meter	•Replace or replatinize probe	Poor response not corrected by above
Conductivity Meter	•Calibrate with each use	Daily (or prior to each use)
Microscope/Stereoscope	•Service/calibration of each ocular micrometer	Annually

PREVENTATIVE MAINTENANCE FOR LABORATORY EQUIPMENT		
INSTRUMENT	***P. M. DESCRIPTION***	***FREQUENCY***
Microscope/Stereoscope	• Clean optics and stage	As needed
pH Meters	•Reference junction & electrode replacement	As needed
pH Meters	•Probe stored in pH standard 4	At all times when not in use
pH Meters	•Other	As described in the manufacturer's manual
pH Meters	•Calibrate with each use	Daily (or prior to each use)
pH meter	•ATC checks	Quarterly
Bottle top dispenser/repipettor	•Calibrate	Quarterly
Bottle top dispenser/repipettor	•Clean to prevent residue buildup	As needed
Water Purifier	Tank Exchange, UV bulb and sleeve replacement (service contract maintenance and check	As needed and annually
Water Purifier	•Replace cartridge and filter	As needed and semi-annual
RDO probe	•Replace sensor cap	Annually
RDO probe	•Clean sensor cap	As needed
RDO probe	•Other	As described in manufacturer's manual
pH/Conductivity/DO meter	•Calibrate with each use	Daily
Light Meter	•Calibrate	Annually

8.3 STANDARDS , REAGENTS AND ORGANISM CULTURES

All reagents and standards must meet the requirements listed in the analytical methods.

Table 8.3A: Stock solution sources, description and related information.
(subject to revision as needed)

Description	Vendor	Storage Req.	Expiration
Conductivity standard 1413	NSI	Ambient	1 yr
pH buffer 4	-VWR	Ambient	1 yr
pH buffer 7	-VWR	Ambient	1 yr
pH buffer 10	-VWR	Ambient	1 yr
Bromothymol blue solution	-VWR	Ambient	1 yr
Potassium phosphate monobasic	-VWR	Ambient	1 yr
Magnesium chloride	-VWR	Ambient in dessicator	1 yr
Potassium Chloride	-VWR	Ambient in dessicator	1 yr
Brine shrimp eggs	Brine Shrimp Direct (BSD)	Ambient, tightly sealed.	1 yr
Calcium sulfate	-VWR	Ambient in dessicator	1 yr
EDTA	-VWR	Ambient in dessicator	1 yr
Sodium thiosulfate	-VWR	Ambient in dessicator	1 yr
pH buffer 4	-VWR	Ambient.	1 yr
YCT	Made in-house	-10 to -20^{o}C	14 days after thawing
Raphidocelis subcapitata	Aq. Biosystems	1-6^{o}C	One month from concentration date

2821 Remington Street
Fort Collins, CO 80525

The source for their organisms is documented on each packing slip received. ESC accepts the packing slip as documentation and verification by the supplier with regard to the taxonomic identification of the bioassay species. The packing slips for bioassay test organisms are kept on file.

The amount of food added to culture vessels depends upon the number of organisms within a given culture. As standard procedure, *Ceriodaphnia dubia* batch cultures are fed 4.5mL of Yeast Cereal leaves, Tout chow (YCT) and *Raphidocelis subcapitata* algal suspension on the day of initiation. Batches are fed as needed. The date, time and the amount the organisms are fed is documented. All yeast purchased is at least food grade and has passed FDA standards. All (YCT) Yeast Trout Chow is made in-house. New lots are tested for pesticides, metals, and PCBs.

Ceriodaphnia dubia, fresh batch cultures are set up on Monday, Wednesday and Friday using newly hatched neonates less than 24 hours old. In addition, a minimum of 4 brood trays are set up daily in order to guarantee organisms of the right age to use in bioassay tests. The *C. dubia* brood trays are fed daily. The *C. dubia* are transferred into fresh water daily after their first brood of neonates is born. Third generation neonates, less than 24 hours old, are used for batch cultures and brood trays. Third generation neonates, less than 24 hours old and hatched within 8 hours of each other, are used for chronic tests. Adults are used as sources for neonates until 14 days of age.

C. dubia are taxonomically identified to species on a quarterly basis. All taxonomy information is documented and kept on file for a year.

Pimephales promelas batch cultures are cleaned as needed by siphoning off the excess food and waste from the bottom of the culture vessel and renewing the water. Cultures are aerated as needed to maintain adequate dissolved oxygen.

Pimephales promelas are taxonomically identified to species on a quarterly basis. All taxonomy information is documented and kept on file for a year.

The water used for culturing is moderately hard synthetic dilution water (SDW) and is prepared by diluting 1L synthetic freshwater concentrate to 20 L ultra-pure deionized water, and vigorously aerating for a minimum of 1 hour. The physical and chemical parameters for each new tank of water prepared are recorded and should fall within the following acceptable range:

1. pH – 7.5- 8.5 units
2. D.O. - greater than 80% saturation in mg/L
3. Specific Conductance - ~250 micromhos/cm
4. Alkalinity - 57-64 mg $CaCO_3$/L
5. Hardness - 80 to 100 mg $CaCO_3$/L
6. Total Residual Chlorine - <0.1 mg/L

8.4 INSTRUMENT CALIBRATION

Lighting

All testing and culturing is maintained in incubators in which temperature is constant and the photoperiod is on a 16-hour light/8-hour dark cycle. The photoperiod is verified and documented quarterly. The light intensity must be within 50 – 100 foot candles (approximately 10-20uE/m^2/s) and is verified and documented quarterly. All incubators are monitored at least weekly for proper light intensity.

pH Meter

The pH meters are calibrated with each use according to manufacturer's instructions. The slope is documented on a daily basis. Ensure the acceptable pH slope range is within the manufacturer's acceptable range prior to use. Perform automatic temperature compensation (ATC) checks quarterly on the pH probe. All calibration information is documented.

Volumetric Equipment

Equipment such as filter funnels, bottles, pipettes, non-Class A and other containers with graduations are calibrated once per lot prior to first use. The error of calibration must not exceed 3.0%.

Analytical Balance

Analytical balances are checked and calibrated semi-annually by a certified technician. Calibration is checked before each use with Class I weights. Class I weights are calibrated annually.

Stereoscope

Maintenance is performed by a trained technician on an annual basis.

Conductivity Meter

The conductivity meter is calibrated with each use according to manufacturer's instructions.

Dissolved Oxygen Meter

The DO meter is calibrated according to manufacturer's instructions with each use. The electrochemical probe membrane is changed every two to four weeks to maintain accurate readings when in use. The RDO probe sensor cap is cleaned regularly, and replaced once per year. The RDO probe sensor cap must be stored in a moist environment.

Test Chambers

Each test chamber is rinsed with DI water prior to introducing the test organisms.

Bottle Top Dispenser/Repipettor

Repipettors are calibrated quarterly to ensure the instrument is dispensing the correct amount. Periodic cleaning is performed to maintain the accuracy and to prevent buildup of residue.

Colorimeter Chlorine tester

The colorimeter is calibrated before each use using standards to verify accuracy.

Light Meter

Calibrate the light meter annually to ensure it meets original performance specifications or purchase new calibrated meter as needed.

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

Deionized water or reverse-osmosis produces water free from bactericidal and inhibitory substances and is used in the preparation of media, solutions and buffers. The quality of the water is monitored for chlorine residual, specific conductance, and heterotrophic bacteria plate count monthly (when in use), when maintenance is performed on the water treatment system, or at startup after a period of disuse longer than one month.

Analysis for metals and organic contaminants is performed quarterly and the Bacteriological Water Quality Test (to determine presence of toxic agents or growth promoting substances) is performed annually. Results of these analyses meet the specifications of the required method and records of analyses are maintained for five years. (An exception to performing the Bacteriological Water Quality Test can be given to laboratories that can supply documentation to show that their water source meets the criteria, as specified by the method, for Type I or Type II reagent water.)

9.2 PH BUFFERS/CONDUCTIVITY STANDARDS

pH buffer and conductivity standard aliquots are used only once. Reagents containers are dated upon receipt and the date opened.

9.3 SECONDARY STANDARDS

Standards are used for retrieval and verification of the factory calibrated colorimeter and are used to verify consistent instrument calibration.

9.4 LABORATORY CONTROL WATER

Control water (moderately hard synthetic dilution water- SDW) is prepared by diluting 1L of synthetic freshwater concentrate to 20L deionized water and aerating for a minimum of 1 hour. The physical and chemical parameters for each new tank of water prepared are recorded and should fall within the following acceptable range:

1. pH – 7.5-8.5 units
2. D.O. - greater than 80% saturation in mg/L
3. Specific Conductance - ~250 micromhos/cm
4. Alkalinity - 57 to 64 mg $CaCO_3$/L
5. Hardness - 80 to 100 mg $CaCO_3$/L
6. Total Residual Chlorine - <0.1 mg/L

Control water (10% dilute mineral water-DMW) is prepared by diluting approximately 2 Liters of Perrier to the 20 Liters mark of a 20 L NALGENE® carboy with ultra-pure

deionized water and aerating for a minimum of 1 hour. The physical and chemical parameters for each new tank of water prepared are recorded and should fall within the following acceptable range:

1. pH – 6.5 to 8.5 units
2. D.O. - greater than 80% saturation in mg/L
3. Specific Conductance - ~95 micromhos/cm
4. Alkalinity - 60 to 70mg $CaCO_3$/L
5. Hardness - 30 to 50mg $CaCO_3$/L
6. Total Residual Chlorine - <0.1mg/L

A given batch of control water is not used for more than 14 days following preparation.

9.5 BRINE SHRIMP

Artemia cysts are certified brine shrimp eggs from Brine Shrimp Direct To determine the quality of the new lots of Brine shrimp, a side-by-side comparison test is performed using the new food and the food of known acceptable quality.

9.6 YCT

YCT-Yeast Cereal leaves and Trout chow is prepared in the laboratory. To determine the quality of the new lots of YCT a side-by-side comparison test is performed using the new food and the food of known acceptable quality.

9.7 ALGAE

Algae- *Raphidocelis subcapitata* are commercially prepared. Upon arrival, each batch received has an accompanying Certificate of Algae Preparation History. The certificate provides the following quality control data: date prepared, species name, inoculation date, harvest date, concentration date and cell count.

9.8 GLASSWARE WASHING, STERILIZATION PROCEDURES AND EQUIPMENT STERILITY CHECKS

Glassware washing and preparation/sterilization procedures are performed according to EPA guidelines and are outlined in *SOP 030701 Glassware Cleaning* and *SOP 350335, Quality Control and Quality Assurance of Microbiological Equipment and Testing Materials.* Before use, examine and discard items with chipped edges or etched inner surfaces. Reusable glassware is cleaned using the following protocol:

- Soak for 15 minutes in hot tap water with detergent and scrub. Rinse thoroughly with tap water. Rinse thoroughly with dilute nitric acid (10%). Rinse thoroughly with deionized water. Rinse thoroughly with pesticide grade acetone. Rinse well with deionized water.

- New glassware is cleaned according to the same procedure as listed above except the first step is preceded by soaking overnight in 10 % HNO_3.

Inspect glassware after washing for excessive water beading and rewash, if necessary. Perform checks on pH and test for inhibitory residues on glassware and plastic ware. Use utensils and containers of borosilicate glass, stainless steel, aluminum, or other corrosion resistant material for media preparation. All biological glassware is purchased pre-sterilized. In-house sterilization of any auxiliary equipment is performed via autoclave.

Pipettes of all sizes are checked for sterility by drawing up non-selective media into the pipette and re-dispensing the volume back into original tube that contained the media. The tube is then incubated and monitored for growth. All results are recorded and maintained within the laboratory.

10.0 ANALYTICAL PROCEDURES

10.1 A list of laboratory SOPs associated with the Aquatic Toxicity laboratory can be found in the following table:

TABLE 10.1: AQUATIC TOXICITY DEPARTMENT SOPs
This Table is subject to revision without notice

SOP #	Title/Description
340312	Dissolved Oxygen Membrane Electrode Method
350301	Fathead Minnow, *Pimephales promelas*, Larval Survival and Growth Test, EPA Method 1000.0
350302	Cladoceran, *Ceriodaphnia dubia*, Chronic Survival and Reproduction Test, EPA Method 1002.0
350303	*Pimephales promelas* Acute Toxicity Testing, EPA Method 2000.0
350303NC	North Carolina *Pimephales promelas* Acute Toxicity Testing
350304	*Ceriodaphnia dubia* Acute Toxicity Testing EPA Method 2002.0
350304NC	North Carolina *Ceriodaphnia dubia* Acute Toxicity Testing
350317	WET Reference toxicant testing
350318	Mini Chronic *C. dubia* NC
350320	Acceptability Test for New Food Batches for WET Testing
350321	Pocket Colorimeter Chlorine Tester Maintenance and Calibration
350322	DO Meter Maintenance and Calibration
350323	Fluke Thermometer Operation and Maintenance
350324	Digital Light Meter Maintenance and Method of Operation
350325	pH Meter Maintenance and Calibration
350326	Thermometer Operation, Maintenance and Calibration Procedure
350327	Bottle Top Dispenser Maintenance and Method of Operation
350328	Conductivity Meter Maintenance and Calibration
350329	Taxonomic Verification/Identification of *Pimephales promelas* - Fathead Minnow
350330	Taxonomic Verification/Identification of *Ceriodaphnia dubia*
350345	Receipt and Maintenance of *Pimephalas Promelas* (Fathead Minnow)
350346	Ceriodaphnia Dubia Culture Maintenance, Food Preparation, and Food Maintenance
350355	Technical Training and Personnel Qualifications for Biomonitoring-Aquatic

SOP #	Title/Description
	Toxicity, Mold and Microbiology
350356	Water Bath and Incubator Temperature Stability and Load Testing
350362	Analytical Balance Operation and Verification in the Aquatic Toxicity Microbiology Lab
350364	North Carolina Phase II Chronic Whole Effluent Toxicity Test Procedure for Ceriodaphnia dubia

10.2 Additional information regarding Aquatic Toxicity testing can be found in:

Method Resources: EPA/821/R-02/013, EPA/821/R-02/012

- 7-Day Fathead Minnow (*Pimephales promelas*) Larval Survival and Growth Test; Test Method 1000.0 from "Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms" (EPA 821-R-02-013).
- 3-Brood *Ceriodaphnia dubia* Survival and Reproduction Test; Test Method 1002.0 from "Short Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms" (EPA 821-R-02-013).
- Fathead Minnow (*Pimephales promelas*) Acute Toxicity Test (24, 48 or 96 hour duration); referenced in "Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms" (EPA 821-R-02-012, 10-02).
- *Ceriodaphnia dubia* Acute Toxicity Test (24, 48 or 96 hour duration); referenced in “Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms” (EPA 821-R-02-012, 10-02)

11.0 QUALITY CONTROL CHECKS

11.1 At a minimum, the following physical and chemical parameters are analyzed for each biomonitoring sample received:

- Temperature - recorded up to twice daily.
- pH - initial and final measurements recorded
- D.O. - initial and final measurements recorded
- Specific Conductance
- Alkalinity
- Hardness
- Total Residual Chlorine

11.2 FEEDING REGIME

- 7-Day Fathead Minnow Larval Survival and Growth Test - Test organisms are fed 0.15mL, per container of 10 organisms. Newly hatched brine shrimp (*Artemia*) are fed to minnow batches 2-3 times daily. Batch cultures are fed depending on organism density.

- 3-Brood *Ceriodaphnia dubia* Survival and Reproduction Test - test organisms are fed 0.15mL of Yeast, Cereal leaves, Trout chow (YCT) and 0.15mL *Raphidocelis subcapitata* algal suspension once daily.
- 24 and 48 Hour Acute Toxicity Tests - organisms are fed 2-5 hours prior to introduction into sample but are not fed for the duration of the test.
- 96-Hour Acute Toxicity Tests – organisms are fed at the 48 hour renewal period.
- 3-Brood *Ceriodaphnia dubia* Survival and Reproduction Test for North Carolina - test organisms are fed .05mL of YCT/15mL test solution and .05 Raphidocelis subcapitata algal concentrate once daily (1.7x10 to the 7th power cells/mL).

11.3 BATCH CULTURES

Batch cultures are identified by date set up or date received. The set-up date is recorded for each batch.

Ceriodaphnia dubia, fresh batch cultures are set up on Monday, Wednesday and Friday using newly hatched neonates less than 24 hours old. In addition, a minimum of 4 brood trays are set up daily in order to guarantee organisms of the right age to use in bioassays. Condition of cultures is monitored daily and documented in the daily log. The *C. dubia* brood trays are fed daily. The *C. dubia* are transferred into fresh water daily after their first brood of neonates is born. Third generation neonates, less than 24 hours old, are used for batch cultures and brood trays. Third generation neonates, less than 24 hours old and hatched within 8 hours of each other, are used for chronic tests. Adults are used as sources for neonates until 14 days of age.

Pimephales promelas, organisms less than 36 hours old are obtained from a commercial supplier and are used immediately for chronic bioassays. Upon receipt, temperature, conductivity, pH, alkalinity and hardness are recorded and the organisms are slowly acclimated to a temperature of 25°C. If more than 10% mortality has occurred in the batch shipment, the batch is rejected and supplier is contacted. The date of the batch culture is recorded and batches are maintained for 14 days after receipt to use in acute tests. Batch cultures are monitored and fed daily. The number of organisms used is recorded in the daily log. Lots are cleaned as needed by siphoning off the excess food and waste from the bottom of the vessel and renewing the water. Minnow lots are aerated to maintain adequate dissolved oxygen. *Pimephales promelas* lots are fed 2.5 mL of newly-hatched brine shrimp per batch, 2-3 times daily. The date, time and the amount the organisms are fed are documented.

11.4 REFERENCE TOXICANT

The reference toxicant used at ESC is potassium chloride. Acute and chronic reference toxicant tests are performed at a minimum of once monthly and upper and lower control limits have been established.

12.0 DATA REDUCTION, VALIDATION AND REPORTING

12.1 DATA REDUCTION

The analyst performs the data calculation functions and is responsible for the initial examination of the finished data. Data reduction steps applied to the raw data are outlined in *SOP 030201 Data Handling and Reporting.* The primary analyst reviews the quality of data based on the following guidelines:

- The appropriate SOP has been followed
- Sample preparation is correct and complete
- Analytical results are correct and complete
- QC is within criteria and complete

All calculations are performed according to the EPA methods manual. When applicable, software is used to perform statistical analysis. All formulae are chosen appropriately depending on the conditions and outcome of each individual test. Due to the complexity of each formula please see EPA/821/R-02/013 for formulae pertaining to Chronic Toxicity tests and EPA/821/R-02/012 for formulae pertaining to Acute Toxicity tests.

TABLE 12.1 Data Reduction Formulas

PARAMETER	FORMULA
IC25, NOEC, LC50, AEC	Toxcalc 5.0 Software

For chronic tests the PMSD and the % CV is calculated and reported.

12.2 VALIDATION

The validation process consists of data generation, reduction review, and reporting results. Once data reduction is complete, validation is conducted by reviewing all data entries and calculations for errors, reviewing all documentation to assure that sample information is correct, and that the tests have been performed appropriately and within the appropriate holding times. The secondary analyst reviews the quality of data based on the following guidelines:

- The appropriate SOP has been followed
- Sample preparation is correct and complete
- Analytical results are correct and complete

12.3 REPORTING

Reporting procedures are documented in *SOP 030201 Data Handling and Reporting* and *SOP 030227, Data Review.*

13.0 CORRECTIVE ACTION

13.1 In the event that a nonconformance occurs in conjunction with the analytical batch, a corrective action response (CAR) form must be completed. The cause of the event is stated on the form and the measures taken to correct the nonconformance clearly defined. The effectiveness of the corrective action must be assessed and noted. The CARs are kept on file by the Regulatory Affairs Department. Corrective action procedures are documented in SOP #030208, *Corrective and Preventive Action*

13.2 Required Corrective Action

All samples and procedures are governed by ESC's quality assurance program. Designated corrective actions are as follows:

13.2.1 Laboratory QC Criteria and Appropriate Corrective Actions

If the analytical method contains acceptance/rejection criteria and it is more stringent than those controls generated by the laboratory the method criteria takes precedence.

13.2.2 Out of control acute toxicity tests.

Rejection Criteria –More than 10% mortality occurs in the control organisms within the specified time frame of the test.

Corrective Action – The test is considered invalid and must be repeated using fresh control water and fresh sample.

13.2.3 Out of control 3-Brood *Ceriodaphnia dubia* Survival and Reproduction Test.

Rejection Criteria – If more than 10% mortality occurs in the control organisms within 96 hours or more than 20% mortality occurs in the test organisms in the 3-brood period (approx. 7 days)

Corrective Action – The test is considered invalid and must be repeated using fresh control water and fresh sample.

13.2.4 Out of control 3-Brood *Ceriodaphnia dubia* Survival and Reproduction Test.

Rejection Criteria – If the average number of young produced in the control is less than 15 per organism

Corrective Action – The test is considered invalid and must be repeated using fresh control water and fresh sample.

13.2.5 Out of control 3-Brood *Ceriodaphnia dubia* Survival and Reproduction Test.

Rejection Criteria – A test is considered invalid if less than 60% (80% for NC tests) of the original number of adult daphnia loaded do not produce three broods within an eight day maximum (7 day maximum for NC tests).

Corrective Action – The test is considered invalid and must be repeated using fresh control water and fresh sample.

13.2.6 Out of control 7-Day *Pimephales promelas* Larval Survival and Growth Test.

Rejection Criteria – If more than 10% mortality occurs in the control organisms within 96 hours or more than 20% mortality occurs in the test organisms in 7 day period.

Corrective Action – The test is considered invalid and must be repeated using fresh control water and fresh sample.

13.2.7 Out of control 7-Day *Pimephales promelas* Larval Survival and Growth Test.

Rejection Criteria – The average weight of the control minnows is less than 0.2500 mg.

Corrective Action – The test is considered invalid and must be repeated using fresh control water and fresh sample.

13.2.8 Out of control Monthly Reference Toxicant:

Rejection Criteria – KCl is the reference toxicant used for acute and chronic testing for the following methods: 1000.0, 1002.0, 2000.0, and 2002.0. If reference toxicant test results fail to meet ESC in-house established criteria (± 2 standard deviations from the mean & median).

Corrective Action – The test is deemed invalid and must be repeated twice. No test will be performed using organisms that fail to meet reference toxicant criteria.

13.2.9 Out of control PMSD 7-Day *Pimephales promelas* Larval Survival and Growth Test.

Rejection Criteria – The PMSD value is greater than the upper value of 30.

Corrective Action - The test may be deemed invalid and should be repeated.

13.2.10 Out of control PMSD 3-Brood *Ceriodaphnia dubia* Survival and Reproduction Test.

Rejection Criteria – The PMSD value is greater than the upper value of 47.

Corrective Action - The test may be deemed invalid and should be repeated.

13.2.11 Out of control %CV 3-Brood *Ceriodaphnia dubia* Survival and Reproduction Test and 7-Day *Pimephales promelas* Larval Survival and Growth Test.

Rejection Criteria – The %CV value is greater than the upper value of 40%.

Corrective Action - The test is deemed invalid and must be repeated.

14.0 RECORD KEEPING

Record keeping is outlined in SOP #030230, *Standards Logger, SOP #030227, Data Review* and SOP #030201, *Data Handling and Reporting*

15.0 QUALITY AUDITS

System and data quality audits are outlined in the ESC Quality Assurance Manual Version 13.0 and *SOP #010104, Internal Audits*.

16.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix IX)	General – Replaced the term “client” with the term “customer” Section 7.1 – Added third bullet point about containers used for collection and holding time of Acute and Chronic tests Table 8.1 – Updated equipment list Table 8.2 – Revised ATC check for pH meter to quarterly Table 8.3A – Added pH=4 buffer Section 8.3 – Minor clarifications about maintenance of in-house cultures Section 8.4 – Revised ATC check for pH meter to quarterly and added language about purchasing a new light meter rather than recalibrating an old one. Section 11.2 – Changed algal species used for 3-Brood Ceriodaphnia dubia Survival and Reproduction Test from Selanastrum capricornutum to Raphidocelis subcapitata

NOTE: The QAM has been approved by the following people.

Eric Johnson, B.S., Director of Operations 615-773-9654

Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Director, 615-773-9684

Christabel Fernandes-Monteiro, PhD. Biology Department Manager, 615-773-9683

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This appendix discusses specific QA requirements for general analytical protocols to ensure that analytical data generated from the Microbiology laboratory are scientifically valid and are of acceptable quality. Any deviations from these requirements and any deviations that result in non-conforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and materials and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in *Section 4.0 in the ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

Dr. Christabel Fernandes-Monteiro, with a Ph.D. in Applied Biology, is the Department Manager of Biology. She oversees supervision of laboratory operations in the Mold, Aquatic Toxicity, Microbiology, Protozoan and BOD laboratories. Her responsibilities include assurance of reliable data through monitoring of quality control, corroborating the analysis performed, protocol development, coordination with customers regarding sample analysis, scheduling of tests and overall production in all sections within the Biology Laboratory, including management of staff. In her absence, Shain Schmitt assumes her responsibilities in the Microbiology laboratory.

Shain Schmitt with a B.S. degree in Conservation Biology, is the Primary Analyst for the Microbiology laboratory. Mr. Schmitt is proficient in microbiological analytical methods and is responsible for sample analysis, review and approval of data associated with microbiological analyses. In his absence, Brandon Etheridge assumes his responsibilities.

5.2 TRAINING

The Primary Analyst or Manager trains new laboratory analysts according to ESC protocol. ESC's training program is outlined in SOP #350355, *Technical Training and Personnel Qualification for Biomonitoring-Microbiology.* Performance is documented using an initial demonstration of capability (IDOCs) and continuing demonstration of capability (CDOC). On-going acceptable capability in microbiological analysis is also demonstrated by acceptable participation in the Phenova proficiency testing program (PTs) and routine laboratory quality control practices. Documentation of analyst training is maintained on file within the department.

6.0 FACILITIES AND LABORATORY SAFETY

6.1 FACILITIES

The main area of the laboratory has approximately 1440 square feet of area with roughly 280 square feet of bench area. There are 300 square feet of additional storage and the lighting is fluorescence. The air system is a five-ton Trane split unit with natural gas for heating. The laboratory reagent water is provided through the Siemans Elga Lab Pure deionizer system. Biohazard containers are located in the laboratory and Stericycle Waste Removal serves as ESC's biological waste disposal contractor. ESC's building information guides and site plan are shown in Appendix I.

6.2 LABORATORY SAFETY

- Laboratory access is limited when work is being performed.
- The following Biosafety Level 2 (BSL2) guidelines are adhered to:
  - Closed-toe shoes are worn in the laboratory
  - Floors and work surfaces are cleaned on a regular basis
  - Emergency numbers are posted in the laboratory
  - Laboratory personnel are trained in the use of the biological spill kit and emergency safety equipment
- ESC's laboratory safety guidelines are detailed in the ESC *Chemical Hygiene Plan*.

7.0 SAMPLING PROCEDURES

7.1 FIELD SAMPLING PROCEDURES, SAMPLE STORAGE, AND HANDLING

- Field Sampling procedures are described in Appendix III of this ESC Quality Assurance Manual. Sample information is recorded and kept on the ESC chain of custody and field logbooks.
- Samples for bacterial analysis are collected directly into pre-sterilized high-density polyethylene (HDPE) sample containers preserved with sodium thiosulfate. The container should be kept closed until sample collection. Once the container is open, do not wash, rinse or contaminate the cap or the inside of the container. For microbiological samples, the container is filled allowing at least 1 inch of headspace per container.
- Sources for microbiological samples are surface waters, waste and drinking water, ground water and soil/sludge.
- Holding times for microbiological drinking water samples is generally 30 hours (except HPC which has a 8 hour holding time). Soil and sludge samples have a holding time of 24 hour and 8 hours depending on the method used. All other water samples have a 8-hour hold time.

- Microbiological samples are shipped in a cooler lined with a heavy-duty plastic bag. Once the sample container lids are secure, the samples are placed in appropriately sized polyethylene bags. The chain of custody is also placed in a plastic bag. The cooler liner is completely filled with ice and the plastic bag sealed tightly with a cable tie. The shipping label contains the name and address of the shipper and is affixed to the outside of the cooler.
- Samples are received in the laboratory login area and are tracked using LIMS (Laboratory Information Management System). A Chain of Custody Form accompanies all samples received by the lab. This is necessary to prove the traceability of the samples and to document the change in possession from sampling to delivery to receipt by the laboratory. Prior to analysis samples are checked for integrity. Sample handling, tracking and acceptance procedures are outlined in *SOP 060105, Sample Receiving.*

8.0 EQUIPMENT

8.1 EQUIPMENT LIST

TABLE 8.1 – LABORATORY EQUIPMENT LIST: MAJOR ITEMS - Microbiological Analysis
This table is subject to revision without notice

Item	*Manufacturer*	*Model*	*Location*
Analytical Balance	Mettler	AT261 Delta Range	Microbiology Lab
Class "I" weights	(2 sets) Troemner		Microbiology Lab
Conductivity Meter	Orion	150 A+	Microbiology Lab
Autoclave	Pelton and Crane	Validator 8	Microbiology Lab
Water Bath	Lindberg Blue	WB1130A	Microbiology Lab
Water Bath	Blue M	MW-1110A-1	Microbiology Lab
Oven	Fisher	655F	Microbiology Lab
Incubator	VWR	2030 22MFG	Microbiology Lab
Quantitray Sealer	IDEXX	2X	Microbiology Lab
Incubator	Precision Sci.	818	Microbiology Lab
Colony Counter	Quebecor		Microbiology Lab
pH Meter	Beckman	pH/Temp/mV/ISE	Microbiology Lab
Refrigerator			Microbiology Lab
Stereoscope (2)	Olympus	SZH-ILLD	Microbiology Lab
UV light; short and long wave	UVP		Microbiology Lab
Autoclave	SterileMax	Harvey	Microbiology Lab
Stereoscope	Olympus	SZX-ILLK100	Microbiology Lab
Water Purifier	Siemans	Elga Lab Pure S4	Microbiology Lab
Oven	VWR	13054	Microbiology Lab
pH meter/Conductivity meter	Thermo Scientific Orion	VStar 52	Aquatic Tox Lab

8.2 EQUIPMENT PREVENTIVE MAINTENANCE, EQUIPMENT CALIBRATION

PREVENTATIVE MAINTENANCE FOR LABORATORY EQUIPMENT		
INSTRUMENT	***P. M. DESCRIPTION***	***FREQUENCY***
Analytical Balances	•Check with Class "I" weights	Daily-tolerance 1 gm - ±0.0001 gm
Analytical Balances	•Service/Calibration (semiannual contract maintenance and calibration check)	10 gm - ±0.01 gm
Analytical Balances	•Service/Calibration (semiannual contract maintenance and calibration check)	Semi-annually
Refrigerators, Incubators, and Water Baths	•Maintenance service	Determined by twice daily temperature performance checks @ least 4 hours apart, when in use.
Water Bath	•Check thermometer vs. NIST traceable	Annually
Water Bath	•Remove from service when not maintaining temperature and send off for repair or replace	As needed
Autoclave	•Check sterilization efficiency	Monthly – Geobacillus stearothermophilus ampoule
Autoclave	•Check sterilization efficiency	With each use– Chemical Indicator Strip
Conductivity Meter	•Calibrate and clean probe	As needed
Conductivity Meter	•Replace or replatinize probe	When poor response not corrected by above
pH	Automatic Temperature Compensation of pH probe	Quarterly
Stereoscope	• Clean optics and stage	Each Use
pH Meters	•Reference junction & electrode replacement	As needed
pH Meters	•Probe stored in pH 4.0 Buffer	At all times when not in use.
pH Meters	•Other	As described in the manufacturer's O & M manual
Autoclave	•Check timing device	Quarterly
pH meter	•Calibrate and check slope (per manufacturer)	Daily
Quanti-Tray Sealer	•Check sealer for leaks	Monthly
Water Purifier	•Conductivity check using a calibrated conductivity meter	Monthly
Water Purifier	•Check for TOCs, ammonia, nitrogen, TRC and heterotrophic bacteria	Monthly
Water Purifier	•Check for single and heavy total metals	Annually
Incubators and Water Baths	Perform temperature stability and load testing	Annually
Autoclave	•Check pressure (annual contract maintenance)	Annually
Autoclave	Check mechanical timing device	Quarterly
Stereoscope	• Clean optics and stage; microscope alignment (annual maintenance contract)	Annually

8.3 STANDARDS AND REAGENTS

All reagents and standards must meet the requirements listed in the analytical methods.

Table 8.3A: Commercially prepared agar/broth, reagent sources, and storage information. ***(subject to revision as needed)***

Agar Type	*Source*	*Storage*
M-FC Broth w/ Rosolic acid	Millipore	4 ± 2°C
A-1 Media (broth)	Hach	4 ± 2°C
mEndo Broth	Hach	4 ± 2°C
Lauryl Tryptose Broth	Hach	4 ± 2°C
Brilliant Green Lactose Broth	Hach	4 ± 2°C
EC media w/ mug broth	Hach	4 ± 2°C
HPC	Hach	4 ± 2°C
Colilert reagent powder	IDEXX	Room temp
Enterolert reagent powder	IDEXX	Room temp
Phosphate Buffer Solution	Weber Scientific	Room temp

All stock agar expirations are per manufacturer specification.

Table 8.3B: In-house prepared agar/broth, reagent sources, and storage information.
(subject to revision as needed)

Agar Type-Stock	*Source*	*Stock Storage*	*Stock Expiration*	*Preparation Components Media*	*Prepared Storage*	*Prepared Expiration*
Plate Count Agar	VWRDifco	Room Temp	As specified by Manufacturer	PCA + Water	4 ± 2°C	3 months
Tryptic Soy Agar	VWRDifco	Room Temp	As specified by Manufacturer	TSA + Water	4 ± 2°C	3 months
Tryptic Soy Broth (TSB)	VWRDifco	Room Temp	As specified by Manufacturer	TSB + Water	4 ± 2°C	3 months
Lauryl Tryptose Broth (LTB)	VWRDifco	Room Temp	As specified by Manufacturer	LTB + Water	4 ± 2°C	3 months
Buffered Rinse Water	VWRDifco	4 ± 2°C	As specified by Manufacturer	KH_2PO_4 + $MgCl_2$+Water	Room temp.	1 year
Heart Infusion Agar	VWR/BD	Room Temp	As specified by Manufacturer	HIA + Water	4 ± 2°C	2 weeks

Membrane Filters and Pads

Membrane filters and pads are purchased and certified to meet the following specifications:

- Filter diameter - 47 mm, mean pore diameter - 0.45 μm. Alternate filter and pore sizes may be used if the manufacturer provides data verifying performance equal to or better than that of 47mm-diam, 0.45-μm-pore size filter. At least 70% of filter area must be pores.
- When filters are floated on reagent water, the water diffuses uniformly through the filters in 15s with no dry spots on the filters.
- Flow rates are at least 55 mL/min/cm^2 at 25°C and a differential pressure of 93kPa.
- Filters are nontoxic, free of bacterial-growth-inhibiting or stimulating substances, and free of materials that directly or indirectly interfere with bacterial indicator systems in the media. Ink grid is nontoxic. The arithmetic mean of five counts on filters must be at least 90% of the arithmetic mean of the counts on five agar spread plates using the same sample volumes and agar media.
- Filters retain the organisms from a 100mL suspension of *Serratia marcescens* containing 1×10^3 cells.
- Water extractables in filters do not exceed 2.5% after the membrane is boiled in 100mL reagent water for 20min, dried, cooled, and brought to constant weight.
- Absorbent pad has diameter 47mm, thickness 0.8mm, and is capable of absorbing 2.0 ± 0.2mL Endo broth.
- Pads release less than 1mg total acidity calculated as $CaCO_3$ when titrated to the phenolphthalein endpoint with 0.02*N* NaOH.
- If the filter and absorbent pad are not sterile, they should not be degraded by sterilization at 121°C for 10min. Confirm sterility by absence of growth when a membrane filter is placed on a pad saturated with tryptic soy broth and incubated at 35 ± 0.5°C for 24h.

8.4 INSTRUMENT CALIBRATION

Autoclave

Prior to first use, autoclaves must be initially evaluated for performance. All initial checks must be recorded and records must be retained on file. With each use, a record of items sterilized, temperature, pressure, and time is kept for each batch processed. Operating temperature is checked and recorded at least weekly with a minimum/maximum thermometer. Performance is tested monthly with *Bacillus stearothermophilus* ampoules. Chemical strips are used with each use to verify that supplies and materials in each cycle have been sterilized. The autoclave mechanical timing device is checked quarterly against a stop watch and actual time elapsed documented. Records of autoclave operations are maintained for every cycle. Records include: date, contents, maximum temperature reached, pressure, time in sterilization mode, total run time (may be recorded as time in and time out) and analyst's initials.

Quebecor Colony counter

A dark field colony counter is used to count Heterotrophic Plate Count colonies. Maintenance is performed per manufacturer's instructions.

Quanti-tray Sealer

The Quanti-tray sealer is checked monthly using 100mL of bromocresol purple, or equivalent dye. The solution is poured into a test tray, sealed, and tested for leaks.

pH Meter/Conductivity Meter

With each use, calibrate the instrument according to the manufacturer's instructions. Verify that the slope of the calibration is within the manufacturer's acceptable range prior to use. Automatic temperature compensation (ATC) verifications are performed quarterly on the pH probe.

Incubators & Waterbaths

Records of temperature checks are documented twice daily at least 4 hours apart when in use. Thermometers used for temperature checks are verified at least annually. Temperature stability and load testing is performed on an annual basis.

Analytical Balances

Analytical balances are checked at least daily prior to each use with class "I" weights. Records of these verifications are maintained within the laboratory. Balances are also serviced and verified and/or calibrated by an external calibration service at least semi-annually.

Volumetric Equipment, IDEXX and Commercially Prepared Phosphate Buffer Bottles

Equipment such as filter funnels, bottles, pipettes, non-Class A glassware and other containers with graduation must be calibrated once per lot prior to the first use. Mechanical hand pipettes, automatic dispensers and diluters are verified for accuracy quarterly. The error of calibration must not exceed 3%.

IDEXX Bottles and Quanti-trays

Prior to first use, IDEXX bottles and Quanti-trays must be checked for fluorescence using a long wave UV light.

Ultraviolet Lamp

The output of the UV lamp used to measure fluorescence for the identification of *E. coli* is tested quarterly with a UV light meter. The UV bulbs are replaced if the output is less than 70% of the original.

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

Reagent Grade water –Type II used in the Microbiology Laboratory is periodically checked for contamination. Type II water is checked annually for single and total heavy metals and organic chemicals. Monthly checks for total organic carbon, ammonia and organic nitrogen, total residual chlorine and a heterotrophic plate count are also conducted. Resistivity and pH are checked continuously or with each use. Conductivity is also checked monthly using a calibrated conductivity meter. The Use test is performed quarterly and the Water Suitability test is performed annually.

9.2 GLASSWARE WASHING , STERILIZATION PROCEDURES AND EQUIPMENT STERILITY CHECKS

Glassware washing and preparation/sterilization procedures are performed according to EPA guidelines and are outlined in *SOP 030701 Glassware Cleaning and SOP 350335, Quality Control and Quality Assurance of Microbiological Equipment and Testing Materials.* Before use, examine and discard items with chipped edges or etched inner surfaces. Reusable glassware is cleaned using the protocol established by the EPA:

- Soak for 15 minutes in hot tap water with detergent and scrub. Rinse thoroughly with tap water. Rinse thoroughly with dilute nitric acid (10%). Rinse thoroughly with deionized water. Rinse thoroughly with pesticide grade acetone. Rinse well with deionized water.
- New glassware are cleaned according to the same procedure as listed above except the first step is preceded by soaking overnight in 10 % HNO_3.

Inspect glassware after washing for excessive water beading and rewash, if necessary. Perform checks on pH and test for inhibitory residues on glassware and plastic ware. Use utensils and containers of borosilicate glass, stainless steel, aluminum, or other corrosion resistant material for media preparation. All biological glassware is purchased pre-sterilized. In-house sterilization of any auxiliary equipment is performed via autoclave.

Pipettes of all sizes are checked for sterility by drawing up non-selective media into the pipette and re-dispensing the volume back into original tube that contained the media. The tube is then incubated and monitored for growth. All results are recorded and maintained within the laboratory.

Inoculating loops are cultured by aseptically transferring the entire tip of the loop into a tube containing non-selective media. The tube is incubated and monitored for growth. Results are maintained within the laboratory.

A sterility check is performed on one container for each lot of purchased, pre-sterilized sample containers, and IDEXX containers. Results are maintained within the laboratory.

A check is performed on one container from each new lot of microbiological sample containers to ensure efficacy of sodium thiosulfate to 15 mg/L chlorine, and documented. A sterility check is performed on each batch of dilution and rinse water prepared in the laboratory and on each batch of commercially prepared water with non-selective growth media prior to first use.

In addition, stock solutions used for preparing rinse water are checked for turbidity prior to each use. If turbid, the stock buffer is discarded or re-sterilized.

9.3 MEDIA STERILITY VERIFICATION PROCEDURES

A sterility check must be analyzed for each lot of pre-prepared media and for each lot of media prepared in the laboratory. This is done prior to the first use of the media used for membrane filtration, MPN, pour plate and chromofluorogenic methods. For media used in the pour plate analytical technique, sterility blanks of the media must be made by pouring an uninoculated plate for each run in addition to sterility and lot comparison tests being performed on each lot prior to first use. Reagents and containers used in chromofluorogenic method tests are checked for fluorescence prior to first use.
All results of the sterility and lot comparison tests are documented.

9.4 POSITIVE AND NEGATIVE CONTROLS USING PURE CULTURES

ATCC Pure Cultures

Positive culture controls demonstrate that the media can support the growth of the target organism(s), and that the media produces the specified or expected reaction to the target organism(s). All media must be tested with at least one pure culture of a known positive reaction. This must be done prior to first use of the media.

Negative culture controls demonstrate that the media does not support the growth of non-target organisms or does not demonstrate the typical positive reaction of the target organism(s). All batches of selective media in the laboratory must be analyzed with one or more known negative culture controls. This must be done prior to first use of the media.

10.0 ANALYTICAL PROCEDURES

10.1 A list of laboratory SOPs associated with the microbiology laboratory can be found in the following table:

TABLE 10.1: MICROBIOLOGICAL DEPARTMENT SOPs
This Table is subject to revision without notice

SOP #	Title/Description
350305	Fecal Coliform: Membrane Filter Technique (SM 9222D)
350315	Fecal Coliform Determination in Biosolids: Membrane Filter Technique (SM 9222D)
350315A	Fecal Coliforms in Sewage Sludge (Biosolids) by MPN Fermentation using A-1 medium (EPA Method 1681)
350316	Total Coliform (SM 9222B)
350321	Pocket Colorimeter Chlorine Tester Maintenance and Calibration
350325	PH Meter Maintenance and Calibration
350326	Thermometer Operation, Maintenance and Calibration Procedure
350328	Conductivity Meter Maintenance and Calibration
350332	Laboratory Maintenance of Bacteria Reference Cultures
350333	QA/QC of Microbiological Equipment and Testing Materials
350343	Colilert (SM 9223B)
350348	Enterolert (ASTM 6503-99)
350354	HPC (SM 9215 B)
350355	Technical Training and Personnel Qualification for Biomonitoring-Microbiology
350356	Water bath and Incubator Temperature Stability and Load Testing
350359	Calibration and Maintenance of Autoclaves
350369	Sterilization, Sanitization and Residue Testing of Microbiological Glassware and Equipment
350380	Class “A” MPN Fecal Coliform Analysis (SM 9221E/C)

10.2 Additional information regarding microbiological testing can be found in:

- Standard Methods for the Examination of Water and Wastewater, Sections 9020 through 9050.
- Heterotrophic Plate Count, SM 9215B
- Fecal Coliform Direct Test (A-1 Media), SM 9221E
- Standard Total Coliform Membrane Filter Procedure, SM 9222B.
- Fecal Coliform Membrane Filter Procedure, SM 9222D.
- Enzyme Substrate Test, SM 9223B.
- Environmental Regulations and Technology, Control of Pathogens and Vector Attraction in Sewage Sludge, Appendix F.
- Fecal Coliforms in Sewage Sludge, EPA 821-R-06-013

11.0 QUALITY CONTROL CHECKS

11.1 ESC participates in microbiological proficiency testing (PTs) in various matrices by analyzing samples provided by Phenova. Blind samples are received and analyzed according to instructions from Phenova and the standard operating procedure.

11.2 Plate count comparison between two analysts is conducted monthly. Acceptable plate count comparisons must be within 10%. Analyst deviations that are outside the 10% range are repeated. If the repeat inter-analyst count is unacceptable, additional procedural training and method reviews are conducted.

11.3 Duplicate analyses are performed on 10% of samples or at least one sample per month for total and fecal coliform and *E. coli* tests. Due to the infrequent laboratory receipt of some samples, duplicate analyses are conducted per sample. If the RPD exceeds 20%, the data is qualified.

11.4 For membrane filtration analyses, sterility control checks are conducted on the filter assembly at the beginning and end of each sequence and following every 10 samples analyzed. If QC blanks fails, the run is rejected or qualified.

11.5 Verification of total coliform and fecal coliform colonies must be conducted monthly (10 colonies/month for wastewater). Colonies found in drinking water samples must have at least five typical sheen colonies and five atypical colonies verified.

11.6 For HPC analysis, duplicate plates are run for each dilution. A positive control and an uninoculated plate performed for each run. If the QC fails, the run is rejected and qualified, and sample re-collected.

11.7 Duplicate counts are performed monthly for colony counts from membrane filtration or pour plated media on one positive sample for each month the test is performed. Each analyst counts typical colonies on the same plate and counts must be within 10% difference to be acceptable, if the laboratory has two or more analysts. The same plate is counted twice by the analyst and difference between counts must be no more than 5% in laboratories with only one analyst.

11.8 For biosolids testing, an Initial Precision and Recovery test (IPR) is performed prior to the first time the method is used and at any time the method or instrumentation is modified. The IPR consists of four Milorganite® samples spiked with *E. coli* (ATCC #25922), and must be accompanied by an acceptable method blank and appropriate sterility checks. Mean percent recoveries from the IPR must fall within the EPA approved QC limits of 1-312%, and Relative Standard Deviation of the recovery should be less than or equal to 96%.

11.9 For biosolids testing, an Ongoing Precision and Recovery sample (OPR) is analyzed after every 20 field and matrix spike samples, or one per week that samples are analyzed, whichever occurs more frequently. The OPR consists of one Milorganite® sample spiked with *E. coli* (ATCC #25922), and must be accompanied by an acceptable method blank and appropriate sterility checks. Recoveries from the OPR must fall within the EPA approved QC limits of 1- 371%.

11.10 For biosolids testing, a Method blank is analyzed everyday samples are processed. The Method Blank must be free of contamination from the target organism, and serve as a sterility control to verify the sterility of equipment, materials, and supplies.

11.11 For biosolids testing, a Matrix Spike (MS) is analyzed when samples are first received from a source from which the laboratory has not previously analyzed samples and

subsequently, 5% of field samples to determine the effect of a particular matrix on fecal coliform recoveries. MS samples must be accompanied by the analysis of an unspiked field sample sequentially collected from the same sampling site, an acceptable method blank, media sterility checks, and an OPR sample if possible. MS percent recoveries must fall within the EPA approved QC limits: Class A Biosolid= 2-541%; Class B Biosolid= >0-6172%, and RSD less than or equal to 182% and 184% for Class A and Class B biosolids, respectively.

11.12 For biosolids testing, control charts for OPR, IPR, and MS are charted and maintained in the laboratory. The control charts graphically display the results of continuing performance when using Method 1681.

12.0 DATA REDUCTION, VALIDATION AND REPORTING

12.1 DATA REDUCTION

The analyst performs the data calculation functions and is responsible for the initial examination of the finished data. Data reduction steps applied to the raw data are outlined in *SOP 030201 Data Handling and Reporting.* The primary analyst reviews the quality of data based on the following guidelines:

- The appropriate SOP has been followed
- Sample preparation is correct and complete
- Analytical results are correct and complete
- QC is within criteria and complete

12.2 VALIDATION

The validation process consists of data generation, reduction review, and reporting results. Once data reduction is complete, validation is conducted by reviewing all data entries and calculations for errors, reviewing all documentation to assure that sample information is correct, and that the tests have been performed appropriately and within the appropriate holding times. The secondary analyst reviews the quality of data based on the following guidelines:

- The appropriate SOP has been followed
- Sample preparation is correct and complete
- Analytical results are correct and complete

12.3 REPORTING

Reporting procedures are documented in *SOP 030201 Data Handling and Reporting.* Microbiological data is reported as Colony Forming Units (CFU) per unit volume, Presence/Absence, or Most Probable Number (MPN)/100mL.

13.0 CORRECTIVE ACTION

13.1 In the event that a nonconformance occurs in conjunction with the analytical batch, a corrective action response (CAR) form must be completed. The cause of the event is stated on the form and the measures taken to correct the nonconformance clearly defined. The effectiveness of the corrective action must be assessed and noted. The CARs are kept on file by the Regulatory Affairs Department. Corrective action procedures are documented in SOP #030208, *Corrective and Preventive Action*

13.2 Required Corrective Action

All samples and procedures are governed by ESC's quality assurance program. Designated corrective actions are as follows:

13.2.1 Laboratory QC Criteria and Appropriate Corrective Actions

If the analytical method contains acceptance/rejection criteria and it is more stringent than those controls generated by the laboratory the method criteria takes precedence.

13.2.2 Out of control plate count comparisons between analysts.

Rejection Criteria – Comparisons must be within ±10% for monthly plate count comparisons.

Corrective Action – Duplicate counts are repeated. If repeat counts are still beyond acceptance range, procedural training and method reviews are conducted.

13.2.3 Out of control duplicate analyses for total and/or fecal coliform or *E. coli*.

Rejection Criteria – Duplicate RPDs must not exceed 20% for total and/or fecal coliform or *E. coli.*

Corrective Action – Data is qualified or the analysis is repeated. If repeat analysis is still beyond acceptance range, procedural training and method reviews are conducted.

13.2.4 Out of control QC blank for membrane filtration analysis.

Rejection Criteria – Blank analyses performed either at the beginning or end of the analytical sequence is positive.

Corrective Action – The analytical sequence may be rejected and reprocessed or qualified based on the nature of the contamination.

13.2.5 Out of Control QC Blank for HPC analysis

Rejection Criteria - Blank analysis performed during each run is positive for growth.

Corrective Action - The analytical run is rejected, and data qualified with an “R” for rejected data, and sample re-collected.

13.2.6 Out of control IPR analyses

Rejection Criteria - Recoveries from IPR fall outside of the required range for recovery: 1 - 312%, and RSD of 96%.

Corrective Action - Identify the problem by evaluating each step in the analytical process, media, reagents, and controls, correct the problem and repeat the IPR.

13.2.7 Out of Control OPR analyses

Rejection Criteria - Recoveries from OPR fall outside of the required range for recoveries: 1-371%.

Corrective Action - Identify the problem by evaluating each step in the analytical process, media, reagents, and controls, correct the problem and repeat the OPR.

13.3.8 Out of Control MS analyses

Rejection Criteria - Recoveries from MS fall outside of the required range for recoveries: Class A Biosolid= 2-541%; Class B Biosolid= >0-6172%, and RSD less than or equal to 182% and 184% for Class A and Class B biosolids, respectively.

Corrective Action - Flag all associated filed data.

14.0 RECORD KEEPING

Record keeping is outlined in SOP #030230, *Standards Logger, SOP #030227, Data Review* and SOP #030201, *Data Handling and Reporting*

15.0 QUALITY AUDITS

System and data quality audits are outlined in the ESC Quality Assurance Manual Version 13.0 and *SOP #010104, Internal Audits*.

16.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix X)	General – Replaced the term “client” with the term “customer” Table 8.1 – Updated Equipment List Table 8.2 – Revised ATC check for pH meter to quarterly Section 8.4 – Revised ATC check for pH meter to quarterly Table 10.1 – Updated SOP List

NOTE: The QAM has been approved by the following people.

Eric Johnson, B.S., Director of Operations 615-773-9654

Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Director, 615-773-9684

Christabel Fernandes-Monteiro, PhD, Biology Manager 615-773-9683

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This appendix discusses specific QA requirements for general analytical protocols to ensure that analytical data generated from the Mold laboratory are scientifically valid and are of acceptable quality. Any deviations from these requirements and any deviations that result in nonconforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and materials and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in Section 4.0 in the *ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

Dr. Christabel Fernandes-Monteiro, with a Ph.D. in Applied Biology, is the Department Manager for Biology. She oversees supervision of laboratory operations in the Mold, Aquatic Toxicity, Microbiology, BOD and Protozoan laboratories. Her responsibilities include assurance of reliable data through monitoring of quality control, corroborating the analysis performed, protocol development, coordination with customers regarding sample analysis, scheduling of tests and overall production in all sections within the Biology Laboratory, including management of staff. Dr. Fernandes-Monteiro oversees the review and approval processes of all data associated with all Biological laboratory sections. She gained experience in Mold analytical techniques at ESC, an AIHA-LAP accredited laboratory, and obtained additional training in microscopic techniques at the McCrone Research Institute. She also reviews AIHA-LAP and EPA online training modules related to the methods being performed in the Mold and BOD Laboratory. In her absence, Bridget Miller assumes responsibility for Mold/BOD departmental decisions.

Bridget Miller, with a BS degree in Biology, is the Primary Analyst in the Mold and BOD laboratory. She is proficient in Mold analytical methods as per AIHA-LAP guidelines. Bridget has gained analytical experience at ESC, an AIHA-LAP accredited laboratory, and obtained additional training in Mold analysis at the McCrone Research Institute. She reviews AIHA-LAP and EPA online training modules related to the methods being performed in the Mold and BOD Laboratory.

5.2 TRAINING

All new analysts to the laboratory are trained by the Primary Analyst or Manager according to ESC protocol. ESC's training program is outlined in SOP #350355, *Technical Training and Personnel Qualification for Biomonitoring-Mold.* Analyst performance in the Mold/BOD Laboratory is documented using an initial demonstration of capability (IDOCs) and continuing demonstration of capability (CDOC). On-going acceptable capability in mold analysis is demonstrated by acceptable participation in the AIHA-PAT proficiency testing programs (EMPAT-Direct Exam and EMPAT-Bacterial/Fungal), Round Robin analysis and daily Quality Control sample analysis. On-going acceptable capability in BOD analysis is demonstrated by acceptable participation in the Phenova proficiency testing program and daily Quality Control sample analyses. Documentation of analyst training, including a copy of college transcripts or degree, is maintained on file within the department.

6.0 FACILITIES AND LABORATORY SAFETY

6.1 FACILITIES

MOLD LAB

The main area of the Mold laboratory has approximately 532 square feet with 167 square feet of bench space. The lighting throughout the laboratory is fluorescence. The air system is a five-ton Trane split unit with natural gas for heating. The laboratory reagent water is provided through the ELGA PureLab Ultra deionizer system. Biohazard containers are located in the laboratory and Stericycle Waste Removal serves as ESC'S biological waste disposal contractor. ESC's building information guides and site plan are shown in Appendix I.

BOD LAB

The main area of the BOD laboratory has approximately 532 square feet of area with 151 square feet of bench space. The lighting standard throughout the laboratory is fluorescence. The air system is a five-ton Trane split unit with natural gas for heating. The laboratory reagent water is provided through the ELGA PureLab Ultra deionizer system. Biohazard containers are located in the laboratory and Stericycle Waste Removal serves as ESC'S biological waste disposal contractor. ESC's building information guides and site plan are shown in Appendix I.

6.2 LABORATORY SAFETY

- Laboratory access is limited when work is being performed.
- All procedures where infectious aerosols or splashes may occur are conducted in biological safety II cabinets.
- The following Biosafety Level 2 (BSL2) guidelines are adhered to:
  - Closed-toe shoes are worn in the laboratory
  - Floors and work surfaces are cleaned on a regular basis
  - Emergency numbers are posted in the laboratory

- Biological safety hoods are tested and certified annually
- Laboratory personnel are trained in the use of the biological spill kit and emergency safety equipment

- ESC's laboratory safety guidelines are detailed in the ESC *Chemical Hygiene Plan*.

7.0 SAMPLING PROCEDURES

7.1 FIELD SAMPLING PROCEDURES, SAMPLE STORAGE, AND HANDLING

- Field Sampling procedure is described in Appendix III of this ESC Quality Assurance Manual. Sample information is recorded and kept on the ESC chain of custody and field logbooks.
- Samples are received in the laboratory login area and are tracked using LIMS (Laboratory Information Management System). A Chain of Custody Form accompanies all samples received by the lab. This is necessary to prove the traceability of the samples and to document the change in possession from sampling to delivery to receipt by the laboratory. Prior to analysis samples are checked for integrity. Sample handling, tracking and acceptance procedures are outlined in SOP #060105*, Sample Receiving.*
- Sample storage procedures are followed using guidance from each approved method and associated department SOP.

8.2 EQUIPMENT PREVENTIVE MAINTENANCE

INSTRUMENT	*P. M. DESCRIPTION*	*FREQUENCY*
Analytical Balances	•Check with Class "I" weights	Daily-tolerance 1 gm - ±0.0001gm
Analytical Balances	•Service/Calibration (semiannual contract maintenance and calibration check)	10 gm - ±0.01 gm
Analytical Balances	•Service/Calibration (semiannual contract maintenance and calibration check)	Semiannually
Refrigerators, Waterbaths, & Incubators	•Maintenance service	As needed - determined by daily temperature performance checks twice daily and at least 4 hours apart
Water Bath	•Check thermometer vs. NIST	Annually

INSTRUMENT	*P. M. DESCRIPTION*	*FREQUENCY*
Water Bath	•Remove from service when not maintaining temperature and send off for repair or replace	As needed
Incubators and Waterbaths	Perform Temperature stability and load testing	Annually
Autoclave	•Check sterilization efficiency	Weekly – *G. stearothermophilus*
Autoclave	•Check sterilization efficiency	Per Use – Chemical Indicator
Autoclave	Check timing devices	Quarterly
Autoclave	Check pressure (annual Maintenance contract)	Annually
Class II Biosafety Cabinet	•Monitor air and UV lamps	Monthly
Class II Biosafety Cabinet	•Inspect for air flow	Quarterly
Class II Biosafety Cabinet	•Recertification according to NSF standard 49	Annually
Turbidimeter	•Maintenance Service	Annually
Turbidimeter	•Check for accuracy using NIST traceable stds	Per Use
Biolog MicroStation	•Maintenance Service	Annually
Microscope	•Service/calibration of each ocular micrometer	Annually
Microscope	•Clean optics and stage, Kohler Alignment	Each Use
pH meters	Calibrate and check slope (acceptablerange)95-	Daily
pH meters	Reference junction & electrode replacement	As needed
pH meters	Probe stored in KCl	At all times when not in use
pH meters	ATC checks	Quarterly
pH meters	Other	As described in manufacturer's O &
BOD SP Robotic Analyzer	Calibrate DO probe	Daily
BOD SP Robotic Analyzer	Clean and Change DO probe membrane	Weekly
BOD SP Robotic Analyzer	Rinse ATU (seed) dispenser using rinse pump option	As needed
BOD SP Robotic Analyzer	Clean rinsing vessel	Every three months or as needed
BOD SP Robotic Analyzer	Replace tubing for dispenser, diluent pump, and rinsing vessel	Annually or as needed

.

8.3 STANDARDS AND REAGENTS

Table 8.3A lists commercially prepared agar sources. Table 8.3 B lists in-house prepared agar sources and storage information. Table 8.3C lists standard sources, receipt, and preparation information for BOD Analysis. Table 8.3D is designed to provide general calibration range information for BOD analysis. These tables may change depending on regulatory requirements, procedural changes, or project needs.

Table 8.3A: Commercially prepared agar sources and storage information.
(subject to revision as needed)

Agar Type	*Source*	*Storage*
Malt Extract Agar w/chloramphenicol (MEA)	HealthLink	4 ± 2°C
DG18 Agar	HealthLink	4 ± 2°C
Modified Cellulose Agar	HealthLink	4 ± 2°C
Tryptic Soy Agar w/Sheep Blood	HealthLink	4 ± 2°C
2 % Malt Extract	Biolog	4 ± 2°C
BUG w/BL	Biolog	4 ± 2°C
BUA w/BL	Biolog	4 ± 2°C

Table 8.3A: Commercially prepared agar sources and storage information. *(subject to revision as needed)*		
Agar Type	***Source***	***Storage***
Biolog Universal Yeast Agar (BUY)	Biolog	4 ± 2°C

Table 8.3D: Working Standard Calibration	
Analysis	***Calibration Standard***
BOD	D.O.- Barometric pressure/temp, Glucose and glutamic acid reference standard

Source of Fungi

A collection of fungi is maintained in the laboratory as training and reference material. The fungi are isolated from proficiency testing samples, laboratory contaminants and customer samples, and stored as Malt Extract Agar slants for 3 months at 4 ± 2ºC. Cultures are sub-cultured every 3 months. Each culture is assigned an accession number, genus, specific epithet, authority, source, and name of collector. Records are maintained in the laboratory in the accession list database.

Source of Bacteria

A collection of bacteria is maintained in the laboratory as training and reference material. The bacterial strains are purchased from an accredited microbiological supply company and are used as positive and negative reference controls. Alternatively, bacterial strains are collected from proficiency testing samples and laboratory contaminants, and stored as Tryptic Soy Agar slants for 3 months at 4 ± 2ºC.

8.4 INSTRUMENT CALIBRATION

Autoclave

Operating temperature is checked and recorded with each use with a minimum/maximum thermometer. Performance is tested weekly with *Bacillus stearothermophilus* ampoules. Chemical strips are used with each batch processed to verify that supplies and materials have been sterilized. Records of autoclave operations are maintained for every cycle. Records include: date, contents, maximum temperature reached, pressure, time in sterilization mode, total run time (may be recorded as time in and time out) and analyst initials.

Incubators & Waterbaths

The record of temperature checks is documented twice daily at least 4 hours apart when in use. Thermometers used for temperature checks are verified at least annually. In addition temperature chart recorders are being used to continuously monitor the temperature in the incubators used for BOD analysis and the BOD Lab.

Analytical Balances

Analytical balances are checked at least daily prior to each use with class “I weights. Records of these verifications are maintained within the laboratory. Balances are also serviced and verified and/or calibrated by an external calibration service at least semi-annually.

Microscope

A record of cleaning and alignment for each microscope is maintained in the laboratory. Each microscope has an ocular micrometer that is verified annually with a stage micrometer. All microscopes are serviced annually by an external microscope service.

Biochemical Oxygen Demand Robotic Analyzer – SOP Number 340303A

The Dissolved oxygen meter is calibrated according to manufacturer's instructions with each use. Air calibration is performed on the DO meter probes to correct DO for the ambient temperature and given local barometric pressure. The local barometric pressure is determined from information provided by the National Weather Service for the Nashville International Airport (BNA) by accessing http://w1.weather.gov/obhistory/KBNA.html.The air calibration is confirmed daily using the Winkler Test. During the analytical sequence, the calibration stability of the DO probes is verified after every ten samples and at the end of sequence, by the analysis of continuing calibration verification (CCV). If either of the readings differs from the initial readings by more than 0.2 mg DO/L., the instrument automatically re-calibrates the DO meters and re-reads everything after the last passing CCVs.

A laboratory control sample (LCS) is prepared from glucose and glutamic acid, and is analyzed in triplicate exactly like a field sample at the beginning of the workgroup, after every twenty samples throughout the run and at the end of the workgroup, to verify that the analytical process is performing accurately.

pH meter

With each use of pH meters, calibrate the instrument according to manufacturer's instructions. The slope is documented on a daily basis. Acceptable pH slope range is per the manufacturer's operating manual. Automatic temperature compensation (ATC) verifications are performed quarterlyon the pH probe.

Turbidimeter

With each use, calibrate the instrument according to manufacturer's instructions. Adjust transmittance to a 100% using a blank reference test tube. Establish appropriate turbidity range on turbidimeter by adding or subtracting 2% T to the percent transmittance measured with the appropriate turbidity standard.

Volumetric equipment

Equipment such as pipettes, non-Class A and other containers with graduations are calibrated once per lot prior to first use. Volumetric equipment that is not disposed of after use is calibrated on an annual basis. The error of calibration must not exceed 3%.

Air Sampler

The air sampling pump used for laboratory environmental monitoring is verified monthly prior to use with a calibrator that is calibrated annually by an ISO 17025 accredited laboratory to ensure its measurement integrity.

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

Reagent Grade water –Type II used in the Mold Laboratory is periodically checked for contamination. Type II water is checked annually for single and total heavy metals, and organic contaminants. Monthly checks for total organic carbon, ammonia and organic nitrogen, total residual chlorine and a heterotrophic plate count are also conducted. Conductivity and pH are checked continuously or with each use. The water suitability test is performed annually and the USE test is performed quarterly.

Prior to first use, a sterility check with non-selective growth media is performed on each batch of reagent water prepared in the laboratory.

9.2 GLASSWARE WASHING AND STERILIZATION PROCEDURES

Glassware washing and preparation/sterilization procedures are performed according to EPA guidelines and are outlined in SOP #030701, *Glassware Cleaning*. The glassware used in the mold laboratory is restricted to microscopic slides, cover slips, and screw capped bottles, vials or flasks for preparation of media. Before use, examine microscope slides, and discard items with chipped edges or etched inner surfaces. Prior to use, clean microscopic slides with 70 % isopropyl alcohol. Examine screw-capped bottles, vials or flasks for chipped inner edges that could leak. Screw-capped bottles, vials or flasks are cleaned using the following protocol:

- Prewash with hot tap water. Wash with hot tap water. Wash with non-foaming powder detergent. Rinse with tap water. Rinse with DI water. Dry and cool.
- New glassware is cleaned according to the same procedure as listed above.

Inspect glassware after washing for excessive water beading and re-wash, if necessary. Perform checks on pH and test for inhibitory residues on glassware and plastic ware. Use utensils and containers of borosilicate glass, stainless steel, aluminum, or other corrosion resistant material for media preparation. Sterilization of any auxiliary equipment is performed via autoclave.

Pipettes of all sizes are checked for sterility by drawing up non-selective media into the pipette and re-dispensing the volume back into original tube that contained the media. The tube is then incubated and monitored for growth. All results are recorded and maintained within the laboratory.

Inoculating loops are cultured by aseptically transferring the entire tip of the loop into a tube containing non-selective media. The tube is incubated and monitored for growth. Results are maintained within the laboratory.

BOD analysis is performed in disposable, pre-sterilized bottles. In the event that glass bottles must be used, the BOD glassware is washed in a commercial laboratory dishwasher using a phosphate free detergent, followed by a nitric acid rinse, with a final rinse of laboratory DI water.

9.3 MEDIA STERILITY VERIFICATION PROCEDURES

A sterility check must be analyzed for each lot of pre-prepared media and for each lot of media prepared in the laboratory. This is done prior to the first use of the media used for membrane filtration, or MPN, or pour plate, and chromofluorogenic methods. For media used in the pour plate testing technique, sterility blanks of the media must be made by pouring an uninoculated plate for each run. All results are documented.

9.4 POSITIVE AND NEGATIVE CONTROLS USING PURE CULTURES

Positive culture controls demonstrate that the media can support the growth of the target organism(s), and that the media produces the specified or expected reaction to the target organism(s). All prepared media must be tested with at least one pure culture of a known positive reaction. This must be done prior to first use of the media.

Negative culture controls demonstrate that the media does not support the growth of non-target organisms or does not demonstrate the typical positive reaction of the target organism(s). All batches of prepared selective media in the laboratory must be analyzed with one or more known negative culture controls. This must be done prior to first use of the media.

New lots of commercially-prepared media are evaluated for suitability using a known positive and negative culture prior to use.

10.0 ANALYTICAL PROCEDURES

A list of laboratory SOPs associated with the Mold and BOD laboratory can be found in the following table:

TABLE 10.1: MOLD DEPARTMENT SOPs

This Table is subject to revision without notice

SOP #	Title
340303	Biochemical Oxygen Demand
350306	Spore Traps
350307	Fungal Andersen
350308	Fungal Quantification
350309	Fungal RODAC
350310	Direct Exam Prep Procedure

SOP #	Title
350311	Fungal Identification
350312	Mold QA/QC
350313	Mold Lab Safety
350314	MUG – E. coli/Coliforms/Enterococcus
350319	Processing of Bacterial Andersen Samples for Quantification
350334	Microscope Usage
350335	Fungal Spore Identification
350342	BART Testing
350347	Processing of Bacterial Swabs, Bulk, Dust and Water Samples for Quantification
350349	Bacterial Identification Using Biolog
350352	Anaerobic Plate Count
350367	Labconco Flaskscrubber Operation and Maintenance
350370	Preparation of Culture Media
350371	Mold lab Autoclave Maintenance and Operation
350379	Mold Lab Reference Culture Maintenance

11.0 QUALITY CONTROL CHECKS

11.1 ESC participates in proficiency testing (PTs) in support of various laboratory accreditations/recognitions. For Mold analyses, PTs are administered quarterly by AIHA-PAT. ESC participates in both the EMPAT Fungal Direct Examination and Bacterial/Fungal Culturable proficiency testing. The samples are received and analyzed by method according to the vendor's instructions and according to the applicable analytical SOP.

For BOD analysis, environmental PTs are purchased from Phenova. The WP studies are completed every 6 months.

11.2 As part of the total spore analysis QC, the laboratory maintains a slide collection with various count levels and genera/groups of spores. Acceptance criteria for the slide collection include counts that are statistically determined (e.g. ±3STD). Each analyst reviews one slide from this collection on each day of analysis. The slides are reviewed on a rotational basis such that a different slide is reviewed each day until the entire slide collection has been examined. The total spore count and acceptance criteria for each slide are calculated and compared with the statistically determined acceptance criteria.

11.3 Each week, a different pure culture is chosen from the culture collection and is identified by an analyst as part of training and continuing QC program.

11.4 Inter- and intra-analyst precision is determined by the re-analysis of samples by the same and different analysts (where possible). The rate of re-analysis by the same analyst (intra-analyst) and by a second qualified analyst (inter-analyst) is 5%, or at least one each month samples are received, for each field of testing. The laboratory uses control charts to compare the intra- and inter-analyst performance to an established control limit.

11.5 Media blanks for viable count analysis are used to monitor media and laboratory procedures for contamination. These blanks are utilized in two ways:

- Laboratory media blanks are unexposed fresh media (either recently received from the manufacturer or newly laboratory prepared) that is incubated under the same conditions as those used for analysis.
- Field blanks are unopened media that is handled identically to field samples. These samplers are returned to the laboratory with sampled media to demonstrate that media utilized was not originally contaminated and did not become contaminated during transport.

11.6 Environmental monitoring of the laboratory air and the surfaces in the Mold laboratory is performed monthly. BSLII hoods are also monitored in the Mold laboratory.

11.7 Round Robin studies are performed for direct examination of fungal air samples in accordance with AIHA-LAP policy requirements. Results for these studies include raw counts and final concentrations for each fungal structure. Acceptance criteria include organism identification, ranking and quantification.

11.8 Analysts also participate in other continuing education activities, including attending seminars and conferences, in-house training meetings, reviews of journal publications and self-taught training on CD.

11.9 For BOD analysis, Initial Demonstrations of Capabilility (IDOCs) are performed during new analyst training and/or prior to acceptance and use of any new or modified method/instrumentation. Continuing Demonstration of Capability must be updated at least annually. The associated data is filed within the department and available for review.

11.10 For BOD analysis, samples are analyzed in batches of 1-20 samples. Each batch must include the following: method blank, seed blank, seed control, seed check, a laboratory control sample run in triplicate, 1 sample duplicate/ 10 samples. A calibration check (CCV) is performed every 10 samples and an additional LCS every twenty samples including the end of the sequence.

11.10.1 A method blank is analyzed for each probe at the beginning and end of the sequence. The method blank is used to define the level of laboratory background and reagent contamination. All blanks must meet method acceptance criteria. If method blanks fail, data is qualified. The depletion of the method blank must be < 0.20mg DO/L but no lower than -0.20 mg DO/L. Multiple dilution water blanks in the same batch using the same dilution water are treated as replicates and averaged. The average of the dilution water blanks in a batch must not be more than 0.20 mg DO/ L.

11.10.2 The Seed Blank/Seed Control/Seed Check must deplete to show that the microorganism population is viable. The seed correction factor should be 0.6-1 mg/L and seed check and seed control should show depletions within 30% between dilutions.

11.10.3 The CCV should not vary more than 0.2mg DO/L within a run.

11.10.4 The BOD value for the LCS must be within 167.5 and 228.5 mg/L.

11.10.5 The RPD for the sample duplicate must be ≤30% for high and low values.

12.0 DATA REDUCTION, VALIDATION AND REPORTING

12.1 DATA REDUCTION

The analyst performs the data calculation functions and is responsible for the initial examination of the finished data. Data reduction steps applied to the raw data are outlined in SOP #030201, *Data Handling and Reporting* and ESC SOP# 030227, *Data Review* The primary analyst reviews the quality of data based on the following guidelines:

- The appropriate SOP is followed
- Sample preparation is correct and complete
- Analytical results are correct and complete
- QC is within criteria and complete

For BOD analysis, the Laboratory Manager or Senior Analyst performs the secondary review of the data package using the ESC SOP# 030227, *Data Review*. The reviewer verifies that the analysis is performed as required and meets method criteria, All associated data is present and complete, and also ensures that any additional documentation is completed as required (i.e. required qualifiers on test reports, case narratives, etc.)

TABLE 12.1 Data Reduction Formulas

PARAMETER	FORMULA
Non-viable (Spore Traps) Mold	$\frac{SporeCount}{m^3} = \frac{\text{number on trace} \times 1000}{\text{Volume of air sampled in liters}}$
Andersen Fungal Viable (Culturable) Mold Spore Andersen Bacterial Viable (Culturable) Bacteria	$\frac{CFU}{m^3} = \frac{\text{raw counts} \times 1000}{\text{Volume of air sampled in liters}}$ $P_c = N\,[1/N + 1/N\text{-}1 + 1/N\text{-}2 + \ldots\ldots 1/N\text{-}r+1]$
Quantitative Fungal/Bacterial	$\frac{CFU}{gm}$ or $\frac{CFU}{Swab} = \frac{\#\text{ of Colonies} \times \text{Dilution Factor}}{\text{Sample Amount}}$
BOD, 5-DAY	$\frac{\text{Initial D.O.} - \text{Final D.O.} - CF}{\%\text{ Dilution Sample}}$ *Calculations are performed by computer software* *CF= (Depletion of Seed Control or Seed Check) X (Vol of Seed in Samples)/Volume of Seed in Seed Control or Seed Check*

PARAMETER	FORMULA
Percent Recovery (%R)	%R = (Observed Value)X(100%) / True Value
Relative Percent Difference (RPD)	RPD = [ABS(Result1-Result2)]X(100%) RPD = [ABS(Result1-Result2)]X(100%)Mean Result
Reporting Limit (RL)	RL (1 ppm) X Final Volume (300 ml)/Initial volume X Dilution Factor

12.2 VALIDATION

The validation process consists of data generation, reduction review, and reporting results. Once data reduction is complete, validation is conducted by reviewing all data entries and calculations for errors, reviewing all documentation to assure that sample information is correct, and that the tests have been performed appropriately and within the appropriate holding times. The secondary analyst reviews the quality of data based on the following guidelines:

- The appropriate SOP is followed
- Sample preparation is correct and complete
- Analytical results are correct and complete

For BOD analysis, once data reduction is complete, validation is conducted by verification that the QC samples are within acceptable QC limits and that all documentation is complete, including the analytical report and associated QC. See Table 12.3 for current QC targets, controls and current reporting limits for BOD analysis.

12.3 REPORTING

Reporting procedures are documented in SOP #030201, *Data Handling and Reporting.*

BOD Control Limits: BOD QC targets are statutory. The laboratory calculated limits verify the validity of the regulatory limits. The BOD QC targets are within the range of 5 to 15% for accuracy, depending on determinative method requirements, and, where applicable, <30% RPD for precision, unless laboratory-generated data indicate that tighter control limits can be routinely achieved. When using a certified reference material for QC sample analysis, the acceptance limits used in the laboratory conform to the provider's certified ranges for accuracy and precision.

Table 12.3: QC Targets for BOD Lab Accuracy (LCS), Precision and RLs *This table is subject to revision without notice*					
Analyte	**Analysis Method**	**Matrix**	**Accuracy Range (%)**	**Precision (RPD)**	**RL (ppm)**
Biochemical Oxygen Demand	SM5210B	W	85-115	≤30	1
Biochemical Oxygen Demand - Carbonaceous	SM5210B	W	85-115	≤30	1

13.0 CORRECTIVE ACTION

13.1 In the event that a nonconformance occurs in conjunction with the analytical batch, a corrective action response (CAR) form must be completed. The cause of the event is stated on the form and the measures taken to correct the nonconformance clearly defined. The effectiveness of the corrective action must be assessed and noted. The CARs are kept on file by the Regulatory Affairs Department. Corrective action procedures are documented in SOP #030208, *Corrective and Preventive Action*

13.2 Required Corrective Action

Control limits are established for each type of analysis. When these control limits are exceeded, corrective action must be taken.

All samples and procedures are governed by ESC's quality assurance program. General corrective actions are followed; however additional and more specific direction is provided in the specific determinative procedure. For more information, see the appropriate SOP.

13.2.1 Laboratory QC Criteria and Appropriate Corrective Actions

If the analytical method contains acceptance/rejection criteria and it is more stringent than those controls generated by the laboratory the method criteria takes precedence.

13.2.2 Out of Control RPD for inter- and/or intra-analyst reanalysis.

Rejection Criteria - RPD value of the original analysis is calculated and must be below the current control limit.

Corrective Action - Both first and second analysts re-analyze the sample until a consensus is reached and the RPD value falls within control limits.

13.2.3 Out of Control RPD for inter-analyst analysis.

Rejection Criteria – All organisms must be accurately identified.

Corrective Action - Both first and second analysts review the sample. The second analyst results are reported to the customer.

13.2.4 Calibration Verification criteria are not met: BOD Analysis

Rejection Criteria see section 8.4

Corrective Action- If the CCV fails, the data may still be used. If the failure persists, check cleanliness of the equipment and stability of the DO probe for subsequent runs. If a problem persists, the group supervisor or Regulatory Affairs Department is notified for further action.

13.2.5 Out of Control Blanks: Applies to Method Blank

Rejection Criteria- Blank depletion is greater than established limit of -0.2 mg DO/L and + 0.2 mg DO/L.

Corrective Action - If the average of the blanks fail, all data must be reported with a qualifier

13.2.6 Out of Control Laboratory Control Standards (LCS)

Rejection Criteria - If the performance of associated laboratory control sample(s) is outside of acceptance limits as listed in Section 12.

Corrective Action - All samples bracketed by the failed LCS must be reported with a qualifier.

13.2.7 Out of Control Duplicate Samples

Rejection Criteria - Lab-generated maximum RPD limit (as listed under precision in Section12)

Corrective Action - The sample and duplicate are reported with a qualifier.

14.0 RECORD KEEPING

Record keeping is outlined in SOP #030230, *Standards Logger, SOP #030227, Data Review* and SOP #030201, *Data Handling and Reporting*

15.0 QUALITY AUDITS

System and data quality audits are outlined in the ESC Quality Assurance Manual Version 13.0 and *SOP #010104, Internal Audits*.

” ”

16.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix XI)	General - Replaced the term “client with the term “customer . Also changed references to AIHA to AIHA-LAP or AIHA-PAT as appropriate. Table 8.1 – Updated Equipment List Table 8.2 – Revised ATC check frequency for pH meters to quarterly Tables 8.3A and 8.3B – Updated Agars Table 8.3C – Added pH=4 buffer Section 8.4 – Revised ATC check frequency for pH meters to quarterly Table 10.1 – Updated SOP list

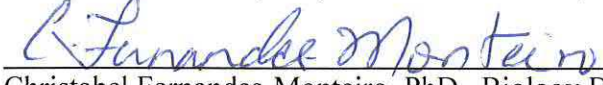
NOTE: The QAM has been approved by the following people.

Eric Johnson, B.S., Director of Operations 615-773-9654

Jim Brownfield, B.S., Compliance Director 615-773-9681

Steve Miller, B.S., Quality Assurance Director, 615-773-9684



Christabel Fernandes-Monteiro, PhD., Biology Department Manager 615-773-9683

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This manual discusses specific QA requirements for EPA Methods 1622 and 1623 to ensure that analytical data generated from the protozoan laboratory are scientifically valid and are of acceptable quality. Any deviations from these requirements and any deviations that result in nonconforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and materials and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in Section 4.0 in the *ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

Dr. Christabel Fernandes-Monteiro, with a Ph.D. in Applied Biology, is the Department Manager of Biology. She oversees supervision of laboratory operations in the Mold, Aquatic Toxicity, Microbiology, Protozoan and BOD laboratories. Her responsibilities include assurance of reliable data through monitoring of quality control, corroborating the analysis performed, protocol development, coordination with customers regarding sample analysis, scheduling of tests and overall production in all sections within the Biology Laboratory, including management of staff. In her absence, Stacy Kennedy assumes her responsibilities in the Protozoan laboratory.

Stacy Kennedy, with a M.S. degree in Biotechnology, is the Principal Analyst for the Protozoan laboratory. Ms. Kennedy is proficient in performing EPA Methods 1622 and 1623. She gained analytical experience from a certified EPA Protozoan Principal Analyst and obtained additional training on microscopic techniques. Also, she frequently reviews EPA online training modules related to the methods being performed.

5.2 TRAINING

The Principal Analyst trains all new analysts in the Protozoan laboratory according to ESC protocol and EPA guidelines. ESC's training program is outlined in SOP #350405, *Training Protocol for Method 1622/1623* and is in accordance with *Supplement 2 to the 5th Edition of the Manual for the Certification of Laboratories Analyzing Drinking Water.* Documentation of training received and authorizations to perform these analyses are maintained within the department.

6.0 FACILITIES AND LABORATORY SAFETY

6.1 FACILITIES

The main area of the laboratory is approximately 420 square feet and has roughly 67.5 square feet of bench area. The microscope dark room is located in the back of the laboratory is 36 square feet with 18 square feet of bench area. Additionally, there is 40 square feet of storage and fluorescent lighting throughout all areas. The air handling system is a five-ton Trane split unit with natural gas for heating. The laboratory reagent water is provided through the Siemans Elga UltraPure deionizer system. Biohazard containers are located in the protozoan laboratory and Stericycle serves as ESC's biological waste disposal contractor. ESC's building information guides and site plan are shown in Appendix I.

6.2 LABORATORY SAFETY

- Laboratory access is limited when work is being performed.
- All procedures where infectious aerosols or splashes may occur are conducted in Biological Safety II cabinets.
- The following Biosafety Level 2 (BSL2) guidelines are adhered to:
  - Closed-toe shoes are worn in the laboratory
  - Floors and work surfaces are cleaned on a regular basis
  - Emergency numbers are posted in the laboratory
  - Biological safety hoods are tested and certified annually
  - Laboratory personnel are trained in the use of the biological spill kit and emergency safety equipment
- ESC's laboratory safety guidelines are detailed in SOP #350408, *Biosafety Guidelines for the Cryptosporidium Laboratory*.

7.0 SAMPLING PROCEDURES

7.1 FIELD SAMPLING PROCEDURES, SAMPLE STORAGE, AND HANDLING

- A description of field sample collection, containers, storage, temperature, and transport times are located in SOP #350402, *Method 1622/1623 Field-Filtering Sample Collection and Laboratory Delivery* and SOP #350403, *Method 1622/1623 Bulk Sample Collection and Laboratory Delivery.*
- Laboratory sample identification, handling, tracking and the information recording system are found in the following procedures: SOP #350404, *Method 1622/1623 Sample Receiving* and SOP #060105, *Sample Receiving*.

- A Chain of Custody and LT2 Sample Collection Form accompanies all compliance samples received by the lab. This is necessary to prove the traceability of the samples and to document the change in possession from sampling through receipt by the laboratory. Prior to analysis, all samples are checked for integrity.
- Following analysis, the slides are maintained for a minimum of 2 months and disposed of following all State and Federal regulations governing disposal.
- Requirements for sample acceptance are located in SOP #350404, Section 7.0, *Method 1622/1623 Sample Receiving*.

8.0 EQUIPMENT

Laboratory equipment specifications are outlined in SOP #350407, *Microscope Analyst Verification,* SOP #350410, *IEC CRU-500 Centrifuge Operation and Maintenance,* SOP #350411, *Lab-Line Multi-Wrist Shaker Operation and Maintenance* and SOP #350413, *Olympus BX40 Microscope Operation and Maintenance.*

8.1 EQUIPMENT LIST

TABLE 8.1 – LABORATORY EQUIPMENT LIST: MAJOR ITEMS - Protozoan

Item	*Manufacturer*	*Model*
Flow control valve	Plast-o-matic	FC050B
Centrifugal pump	Jabsco	18610-0271
Graduated container	Nalgene	20 Liter Carboy
Laboratory shaker	Lab-Line	3587-4
Laboratory shaker side arms	Lab-Line	3589
1500 XG swinging bucket centrifuge	Damon/IEC Division	CRU-5000
Sample mixer/rotator	DYNAL	Cat#: 947.01
Magnetic Particle Concentrator	DYNAL	MPC-1
Magnetic Particle Concentrator	DYNAL	MPC-S
Magnetic Particle Concentrator	DYNAL	MPC-6
Flat-sided sample tubes	DYNAL	Cat#: 740.03
Epifluorescence/differential interference contrast microscope	Olympus	BX-40
Excitation/band pass microscope for fluorescein isothiocyanate (FTIC)	C-Squared	UN3100
Excitation/band pass filters for 4',6-diamidino-2-phenylindole (DAPI)	C-Squared	UN41001

8.2 EQUIPMENT PREVENTIVE MAINTENANCE, EQUIPMENT CALIBRATION

Calibration of equipment is conducted on an annual and/or semi-annual basis and is documented. Maintenance and cleaning is conducted on an as needed basis or per manufacturer's instructions. Equipment cleaning is specified in SOP #350412, *Cryptosporidium Laboratory Equipment Cleaning.*

TABLE 8.2 – PREVENTATIVE MAINTENANCE AND CALIBRATION FOR LABORATORY EQUIPMENT		
INSTRUMENT	***P. M. DESCRIPTION***	***FREQUENCY***
Balances (Top Loader or Pan)- capability of detection of 0.1 g for a load of 150 g, and 1 mg for a load of 10 g or less.	Service/Calibration (maintenance and calibration check) Verified using ASTM Class 1,2, or 3 weights Non-reference weights should be calibrated	Annually by a qualified independent service tech Monthly Every six months
pH meter	Electrodes should be maintained Slope determination Meter standardized with pH 7.0, and either 4.0 or 10.0 pH buffers	Per manufacturer's instructions Monthly (Acceptable slope= 95-105%) Each use period
Thermometer- Glass and Electronic Continuous recording devices Reference Thermometer	Calibration checked with NIST certified traceable reference thermometer or one traceable to a NIST reference thermometer Re-calibrated Re-calibrated	Annually Annually Annually by a certified service technician
Autoclave	Maintenance Check Sterilization efficiency Maximum temperature registering Automatic timing mechanism Clean door seals, drain screen, remove debris	Annually by a qualified independent technician Monthly- Geobacillus stearothermophilus ampoule With each use–Chemical Indicator Strip With each use Quarterly As needed
Conductivity Meter	Calibrated using a low level certified traceable standard or determine cell constant	Monthly per manufacturer instructions
Refrigerator	Record temperature	Daily when in use
Micropipettes	Calibrated	Annually
Hand Tally or Digital/Electronic Counter	Checked to confirm accuracy and operational status	Periodically as needed
Centrifuge	Clean and disinfect after spills/leakage Service/Calibration	Periodically as needed Annually by a qualified service technician
Microscope	Service Alignment and adjustment of optics Stage Micrometer calibration Kohler illumination procedure	Annually With each use Annually With each use
DI unit	Manufacturer's instructions	As needed

8.3 STANDARDS AND REAGENTS

Table 8.3A: Stock solution sources, description and related information.
(subject to revision as needed)

Description	Vendor	Concentration	Storage Req.	Expiration
Sodium Hydroxide (NaOH)	VWR	Concentrated	ambient	1 year
Hydrochloric Acid (HCl)	VWR	Concentrated	ambient	1 year
Laureth-12	VWR	--	ambient	1 year
Tris Stock	VWR	--	ambient	NA
EDTA	Sigma-Aldrich	0.5 M, pH 8.0	2 - 8°C	1 year
Antifoam A	Sigma-Alrich	--	ambient	NA
Dynabeads® GC-Combo/Crypto	Idexx	--	2 - 8°C	2 years
Direct labeling kit for det. of oocysts and cysts, Merifluor Cryptosporidium/Giardia	VWR	--	2 - 8°C	1 year
Phosphate Buffered Saline (PBS) Solution, pH 7.4	Sigma-Aldrich	--	ambient	1 year
4', 6-diamidino-2-phenylindole (DAPI) stain	Waterborne, Inc	2mg/mL	2 - 8°C /Darkness	18 months/When positive control fails
Purified, live *Cryptosporidium* oocysts stock suspension	WSLH	--	2 - 8°C	1 month
Purified, live *Giardia* cysts stock suspension	WSLH	--	2 - 8°C	1 month

Table 8.3B: Working Solution Descriptions and Related Information.
(subject to change)

Solution	Concentrations	Storage Requirements	Expiration
Sodium Hydroxide (NaOH)	6.0 N	ambient	1 year
Sodium Hydroxide (NaOH)	1.0 N	ambient	1 year
Hydrochloric Acid (HCl)	6.0 N	ambient	1 year
Hydrochloric Acid (HCl)	1.0 N	ambient	1 year
Hydrochloric Acid (HCl)	0.1 N	ambient	1 year
Laureth-12 stock vials	10g/100mL	0°C to –20°C	1 year
Tris Working Solution	1 M, pH 7.4	ambient	3 months
Elution Buffer	--	ambient	1 week
1X SL Buffer A Solution	--	2 - 8°C	Prepared Daily
Staining 1X wash buffer	--	ambient	3 months
Phosphate Buffered Saline (PBS) Solution, pH 7.4	--	ambient	1 week
Working DAPI stain	10µL Stock/25ml Phosphate Buffer	Ambient/Dark container	1 day

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

ASTM Type II grade water: Reagent water is analyzed for total chlorine, heterotrophic bacteria, specific conductance, pH, total organic carbon, ammonia and organic nitrogen on a monthly basis. Reagent water is tested for metals: Lead, Cadmium, Chromium, Copper, Nickel, and Zinc on an annual basis. A Use Test is performed on a quarterly basis. Reagent water used for preparing reagents must meet the following acceptance criteria:

Parameter	Limits	Frequency
Conductivity	>0.5 megaohms or <2 µmhos/cm (µseimens/cm) at 25 deg C	Monthly
Pb, Cd, Cr, Cu, Ni, Zn	Not greater than 0.05mg/L per contaminant. Collectively not greater than 0.1mg/L	Annually
Total Residual Chlorine	< 0.1 mg/L	Monthly
Heterotrophic Plate Count	<500 CFU/mL or MPN <500/mL	Monthly

9.2 GLASSWARE WASHING AND STERILIZATION PROCEDURES

Glassware washing and preparation/sterilization procedures are outlined in SOP #350414, *Steamscrubber Operation and Maintenance,* SOP #350408, *Biosafety Guidelines for Cryptosporidium Laboratory* and SOP #350412, *Cryptosporidium Laboratory Equipment Cleaning*.

Laboratory glassware and plasticware are checked for acceptability prior to use. Glassware acceptance criteria are documented in SOP #350412, *Cryptosporidium Laboratory Equipment Cleaning*.

10.0 ANALYTICAL PROCEDURES

10.1 A list of laboratory SOPs associated with the protozoan laboratory can be found in the following table:

TABLE 10.1: PROTOZOAN DEPARTMENT SOPs

This Table is subject to revision without notice

SOP #	Title
350401	Isolation & Identification of *Giardia* and/or *Cryptosporidium* in Water
350402	Method 1622/1623 Field-Filtering Sample Collection and Laboratory
350403	Method 1622/1623 Bulk Sample Collection and Laboratory Delivery
350404	Method 1622/1623 Sample Receiving
350405	Training Protocol for Method 1622/1623
350406	Data Collection and Verification for Method 1622/1623

SOP #	Title
350407	Microscope Analyst Verification
350408	Biosafety Guidelines for *Cryptosporidium* Laboratory
350409	IPR, OPR and MS Spiking Procedures and Corrective Actions
350410	IEC CRU-5000 Centrifuge Operation and Maintenance
350411	Lab-Line Multi-Wrist Shaker Operation and Maintenance
350412	*Cryptosporidium* Laboratory Equipment Cleaning
350413	Olympus BX40 Microscope Operation and Maintenance
350414	Steamscrubber Dishwasher Operation and Maintenance

10.2 The following references are used for analytical procedures conducted in the laboratory:

- EPA. Method 1623: *Cryptosporidium* and *Giardia* in Water by Filtration/IMS/FA, December 2005.
- EPA. Method 1622: *Cryptosporidium* in Water by Filtration/IMS/FA, December 2005.
- EPA. Microbial Laboratory Guidance Manual for the Final Long Term 2 Enhanced Surface Water Treatment Rule. February 2006.
- Supplement 2 to the Fifth Edition of the Manual for the Certification of Laboratories Analyzing Drinking Water, EPA 815-F-12-006, November 2012

11.0 QUALITY CONTROL CHECKS

11.1 ESC participates in proficiency testing (PT) through the analysis of spiked vials received from Wisconsin State Laboratory of Hygiene (WSLH) and analyzed according to study instructions and the ESC SOP. When the analysis is completed, the results are reported to the PT sample provider who issues the testing results as either a "pass" or "fail" to all regulatory agencies, as requested by ESC. If the laboratory fails a PT round, a follow-up test is performed in an attempt to meet the necessary requirements for proficiency. If the follow-up test results in a second failure, the laboratory takes part in re-training .

11.2 An Initial Precision and Recovery test (IPR) is performed prior to the first time the method is used and at any time the method or instrumentation is modified. The IPR consists of four reagent water samples spiked with 100-500 oocysts from a spiking vial received from Wisconsin State Laboratory. Recoveries from the IPR must fall within the EPA approved QC limits: Oocysts= 24- 100% and Cysts= 24-100%, and the Relative Standard Deviation (RSD) of the four recoveries should be less than or equal to 55% for Cryptosporidium, and less than or equal to 49% for Giardia.

11.2 An Ongoing Precision and Recovery sample (OPR) is analyzed once weekly or per 20 samples, and before any field samples are processed. The OPR is spiked with 100-500 cysts and/or oocysts from a spiking vial received from the WSLH. Recoveries from the OPR must fall within EPA approved QC limits: Oocysts = 33-100% and Cysts = 14-100%.

11.3 A Method Blank is also analyzed at least once weekly or per every 20 samples processed, and before any field samples are processed. The Method Blank must be free of test organisms and serves as a sterility control on the analytical system.

11.4 If either sample falls outside acceptance parameters, corrective action must be taken and the samples re-analyzed until the QC criteria are met. Customer samples may only be analyzed following acceptable QC sample results. Quality control information is located in SOP #350409, *IPR (Initial Precision and Recovery), OPR (Ongoing Precision and Recovery) and MS (Matrix Spike sample), Spiking Procedures and Corrective Actions.*

11.5 Customers are required to send a duplicate sample early in their sampling schedule and then again after every 20 field samples collected. This duplicate is utilized in the laboratory as a Matrix Spike (MS). The MS is spiked in the same manner and with the same number of organisms as the OPR to determine the effects of the matrix on the analytical process. The recoveries from matrix spike /matrix spike duplicates must fall within the EPA approved QC limits for oocysts= 13-111% and cysts= 15-118%.

11.6 Inter/intra-analyst precision is determined, at least monthly for verification of analyst performance to assess and maintain consistency in slide examination among analysts. Quality Control information is located in SOP #350407, *Microscope Analyst Verification.*

11.7 Control charts of OPR and MS recoveries are maintained in the laboratory. The control charts graphically display the results of continuing performance when using Methods 1623 and 1622. If recoveries fall outside the control limits, or declining trends are observed, corrective action must be taken to investigate the potential causes of the outlying result.

11.8 Positive staining controls are used to verify that the FITC and DAPI stains are fluorescing at the appropriate intensity and uniformity. Negative staining controls are examined to verify that no oocysts or interfering particles are present. Both staining controls are examined using protocols as stated in ESC SOP # 350401 and meet criteria for EPA 1623 or EPA 1622.

11.9 IMS controls are used in the event of low recoveries to rule out any IMS steps as the cause. The IMS controls are processed beginning with the IMS procedure using protocols as stated in ESC SOP #350401, and meet criteria for EPA 1622 or EPA 1623.

12.0 DATA REDUCTION, VALIDATION AND REPORTING

12.1 DATA REDUCTION

- The analyst performs the data calculation functions and is responsible for the initial examination of the finished data. Data reduction steps applied to the raw data are outlined in SOP #350401, *Isolation and Identification of*

Cryptosporidium and/or Giardia in Water and SOP #350406, *Data Collection and Verification for Method 1622/1623.*

12.2 VALIDATION

Guidelines for data validation are found in SOP #350406, *Data Collection and Verification for Method 1622/1623.* In general, data integrity involves reviewing all data entries and calculations for errors, reviewing all documentation to assure that sample information is correct and complete, and that the tests have been performed appropriately and within the appropriate sample holding times. The secondary analyst reviews the quality of data based on the following guidelines:

- The appropriate SOP is followed
- Sample preparation is correct and complete
- Analytical results are correct and complete

12.3 REPORTING

Reporting procedures are documented in SOP #350406*, Data Collection and Verification for Method 1622/1623.* Depending on the needs of the customer, one or more of the following may be included: Case narrative, Chain of Custody, Internal Chain of Custody, Final Report, Raw Data, etc. When the package involves more than just QC forms, it must contain a Table of Contents and Pagination. When the package is complete, it must be reviewed first by the Primary Analyst followed by the Department Manager or second qualified analyst. The final reviewer signs that the information is complete and the package is ready for submission to the customer. A copy of the final package must be kept on file.

13.0 CORRECTIVE ACTION

13.1 In the event that a nonconformance occurs in conjunction with the analytical batch, a corrective action response (CAR) form must be completed. The cause of the event is stated on the form and the measures taken to correct the nonconformance clearly defined. The effectiveness of the corrective action must be assessed and noted. The CARs are kept on file by the Regulatory Affairs Department. Corrective action procedures are documented in SOP #030208, *Corrective and Preventive Action*

Corrective action procedures that are specific to Cryptosporidium and Giardia analyses are documented in the SOP #350409, *IPR (Initial Precision and Recovery), OPR (Ongoing Precision and Recovery) and MS (Matrix Spike sample), Spiking Procedures.*

13.2 Required Corrective Action

Control limits have been established for each type of analysis. When these limits are exceeded, corrective action must be taken. Calculated sample spike control limits are also used.

All samples and procedures are governed by ESC's quality assurance program. General corrective actions are as follows; however additional and more specific direction is provided in the specific determinative procedure. For more information, see the appropriate determinative SOP.

13.2.1 If a spiked sample or set of samples fails to meet quality control limits

Rejection Criteria - Recoveries from the OPR fall beyond the approved QC limits.

Corrective Action - Examine the spiking suspension organisms directly. To determine if the failure of the spike is due to changes in the microscope or problem with the antibody stain, re-examine the positive staining control, check Kohler illumination, and check the fluorescence and DAPI. To determine if the failure of the spike is attributable to the separation system, check the system performance by spiking a 10mL volume of reagent water with 100-500 cysts and/or oocysts and processing the sample through the IMS, staining and examination procedures. Recoveries should be greater than 70% of the expected concentration. If the failure of the spike is attributable to the filtration/elution/concentration system, check the system performance by processing spiked reagent water according to the method and filter, stain and examine the sample concentrate. This process is performed until the cause of the failure is isolated and corrected. The sample then must be re-analyzed until acceptable results are achieved.

13.2.2 Method Blank contains positive organism when analyzed.

Rejection Criteria – The Method Blank must be free of test organisms and serves as a sterility control on the analytical system.

Corrective Action - Equipment used to process the sample may be cleaned and/or replaced. Reagents used to process the sample may be disposed of and new reagents purchased or prepared. A new method blank is prepared and analyzed. This process is repeated until the method blank passes the acceptance criteria.

13.2.3 Inter/intra-analyst precision analyses are beyond $\pm$10%.

Rejection Criteria – Results for inter and/or intra-analyst precision must be within 10% of original results.

Corrective Action - The differences are discussed between analysts until a consensus is found.

13.2.4 Holding time on sample exceeded or not received at appropriate temperature.

Rejection Criteria - The sample not received on day of collection must be received at the laboratory at $\leq$ 20.0°C and not frozen, and within 96 hours holding time.

Corrective Action - The samples must be re-collected.

13.2.5 Positive and Negative staining controls fail.

Rejection Criteria - If a positive and negative staining control fails all slides that were stained in that batch have failed and samples must be re-collected.

Corrective Action - If positive staining control fails due to faintness, fading or diffusion of the DAPI stain, the holding time may be reduced, or the concentration of the DAPI staining solution may be adjusted so that fading or diffusion does not occur. This process is performed until the cause of the failure is isolated and corrected. The sample then must be re-analyzed until acceptable results are achieved.

14.0 RECORD KEEPING

Record keeping is outlined in SOP #030230, *Standards Logger, SOP #030227, Data Review* and SOP #030201, *Data Handling and Reporting*

Hard copy data of benchsheets and slide examination forms for all compliance monitoring samples, including both field and MS samples, and OPR samples and MB are archived. Benchsheets and slide examination forms for all ongoing PT samples are stored in the laboratory. Documentation for IPR and initial PT data for each method variation used for compliance samples is also archived in the laboratory.

15.0 QUALITY AUDITS

System and data quality audits are outlined in the ESC Quality Assurance Manual Version 13.0 and *SOP #010104, Internal Audits*.

” ”

16.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix XII)	General - Replaced the term “client with the term “customer Table 8.3A – Updated vendors Section 11.5 – Added MS/MSD criteria

1.0 SIGNATORY APPROVALS

RADIOCHEMISTRY LAB QUALITY ASSURANCE MANUAL

APPENDIX XIII TO THE ESC QUALITY ASSURANCE MANUAL

for

ESC LAB SCIENCES
311 N ASPEN AVENUE
BROKEN ARROW, OK 74012
(918) 251-2515

Prepared by

ESC LAB SCIENCES
12065 LEBANON ROAD
MT. JULIET, TENNESSEE 37122
(615) 758-5858

NOTE: The QAM has been approved by the following people.

Ron Eidson, Director of Radiochemistry 918-251-2515

Jim Brownfield, Compliance Director 615-773-9681

Steve Miller, Quality Assurance Director, 615-773-9684

2.0 APPENDIX TABLE OF CONTENTS

3.0 SCOPE AND APPLICATION

This manual discusses specific QA requirements for general analytical protocols to ensure analytical data generated from the Radiochemistry Laboratory are scientifically valid and are of acceptable quality. Any deviations from these requirements and any deviations that result in nonconforming work must be immediately evaluated and their corrective actions documented.

4.0 LABORATORY ORGANIZATION AND RESPONSIBILITIES

ESC Lab Sciences offers diverse environmental capabilities that enable the laboratory to provide the customer with both routine and specialized services, field sampling guidance and materials, and broad laboratory expertise. A brief outline of the organization and responsibilities as they apply to the ESC Quality Assurance Program is presented in *Section 4.0 in the ESC Quality Assurance Manual.*

5.0 PERSONNEL AND TRAINING

5.1 PERSONNEL

Ron Eidson, with a BS degree in Chemistry, is the Director of Radiochemistry and is responsible for the overall production of the Radiochemistry Laboratory; including the management of the staff and scheduling. Mr. Eidson has 28 years of hands-on experience in radiochemical analyses and 25 years in Laboratory Management. He developed an expertise in uranium, radium and thorium while managing a lab at a uranium processing facility. He later launched his own radiochemical testing lab and served as Lab Director and Radiation Safety Officer for 20 years. Ron has provided radiological consultation on projects for the NRC, DoD, DOE, EPA, USACE and for many decommissioning and industrial sites. He is often called on to use his exceptional knowledge and understanding of radiochemical processes to solve complicated matrix issues. In his absence, Raymond Thomas assumes responsibility for departmental decisions in the Radiochemistry Laboratory.

Raymond Thomas , with a BS Chemistry and BA Physics, is the QA Officer for the Radiochemistry Laboratory. Mr. Thomas has 28 years of experience in radiochemical analyses. He develops, updates, and maintains Standard Operating Procedures; calibrates and maintains instrumentation for radiochemical analysis; provides an independent review and approval of analytical data and reports; and conducts internal audits.

5.2 TRAINING

5.2.1 All new analysts to the laboratory are trained according to ESC protocol. ESC's training program is outlined in *SOP 030205 Technical Training and Personnel Qualifications.* Training is intended to provide personnel with the information and guidance needed to help maintain a safe work environment for the production of quality results. The following training is provided for all employees and contract personnel:

- Radiation Safety training upon hire and annually thereafter.
- Written training through the use of laboratory Standard Operating Procedures (SOP's). Technicians must read and sign a certificate of understanding of the latest version of the SOP before they are released to perform that job.
- On the job training is used to train personnel in hands-on use of the method and instrumentation.
- Initial Demonstrations of Capability (IDOCs) and Continuing Demonstrations of Capability (CDOCs) are used to demonstrate the ability to perform a method satisfactorily.
- Analyst training records are maintained on file within the department.
- Training courses or workshops on specific equipment, analytical techniques or laboratory procedures are conducted from time to time. The documentation is retained along with other training records.
- Safety training is conducted monthly.
- Data integrity and computer security training is conducted upon hire and annually thereafter.

6.0 FACILITIES, LABORATORY SAFETY, AND LABORATORY WASTE

6.1 FACILITIES

ESC's radiochemical lab currently occupies 7500 square feet in Broken Arrow, OK.

- 24 hour monitored access for the security of samples and data
- Controlled and separated sample storage areas
- Unencumbered work spaces in each lab
- Fully integrated hood system to remove any toxic or hazardous fumes that might be evolved when using organic solvents or that may be formed during an acid digestion. The laboratory fume hood face velocity is checked monthly for optimum face velocity.
- Laboratory Information Management System (LIMS) for sample tracking
- On-site and secure data archive area
- File backup to prevent loss of data

6.2 LABORATORY SAFETY

It is management's responsibility ensure that the work environment is safe for all employees and that conditions facilitate correct performance of the environmental tests. The following are just a few measures taken at ESC:

- Sign In Log – all employees and visitors are required to sign in and out of the laboratory. The last employee present is not permitted to perform analyses alone.
- Protective Eyewear, Gloves and Lab Coats – these are provided and are to be worn at all times in the sample preparation section of laboratory.
- TLD (Thermoluminescent Dosimeter) – badges are provided for all employees and visitors to detect possible beta and gamma radiation sources and are to be worn at all times in the laboratory.
- Training – All employees receive training relevant to their particular job prior to beginning the job. Standard Operating Procedures must be read and are available to reference at all times. Monthly Health & Safety training is provided to reiterate the need for attention to detail and Radiation Safety Training is conducted upon hire and annually.
- Safety Equipment – safety showers, eyewashes and fire extinguishers are checked monthly to ensure proper functionality.
- Adequate space and equipment – are provided as available to ensure optimum safety of our employees.
- Internal Audits – are conducted at least annually to ensure laboratory procedures are conducted not only in accordance with quality standards but in a safe manner.
- Constant monitoring – Airflow, temperature and barometric pressure are monitored to ensure a comfortable environment safe from fumes.
- Radiation Surveys – All solid samples are surveyed upon receipt and segregated if radiation is found. Laboratory countertops, floors and instrumentation are frequently surveyed to prevent contamination.
- Segregation – Incompatible areas are separated; standards and samples are segregated as is glassware used for elevated samples.
- Good Housekeeping – daily, monthly and quarterly checklists are followed to ensure cleanliness.

6.3 LABORATORY WASTE

As an active member of the environmental industry, ESC is aggressively interested in the preservation and cleanup of our environment. Any waste generated in the laboratory is disposed in a responsible manner. It is a policy at ESC that all hazardous or radioactive samples and any waste corresponding to these samples are returned to the client for disposal. In this way, ESC minimizes the amount of radioactive material on site to primarily sources and standards.

Prior to disposal solid wastes and chemicals are properly labeled and packaged. They are then transported to a disposal facility. ESC's main disposal methods are:

- Non-hazardous/non rad soil samples - dumped into waste bin.
- Non-hazardous/non rad water samples - neutralized with lime or Sodium Hydroxide and flushed down sink with sufficient water to thoroughly wash out the sink and pipes.
- Lead Waste - Disposed by a licensed facility or recycled.
- Acid Waste - Neutralized with lime or Sodium Hydroxide and flushed down the acid drain with copious amounts of water.
- Organic Waste From Extractions - Disposed of by a licensed facility or recycled.
- Mercury Waste - Disposed by a licensed facility.
- Oil Waste - If toxic, the oil waste will be disposed of by returning to the client or it is transported to a disposal facility.
- Bioassay Samples – flushed down drain or stool.
- Empty chemical or acid containers are thoroughly rinsed before placing in the general trash. Empty sample containers are disposed of in the general trash after the customer's name has been made unreadable.

7.0 SAMPLING PROCEDURES AND HANDLING OF SAMPLES

7.1 SAMPLING PROCEDURES

SOP GEN-18 outlines the instructions that ESC personnel use to collect specific liquid samples from a customer. The laboratory does not currently provide services for solid samples or development of site specific, customized sampling plans. The sampling and testing directives of the customer are followed with the customer assuming responsibility for the suitability of the sampling plan and satisfaction of permit requirements.

7.2 HANDLING OF SAMPLES

The complete procedure for sample control is outlined in GEN_01. A sample is tracked at ESC from the moment it is received to a point in time that the sample can be disposed of properly. It is logged in as described below and all paper work involved is distributed to parties of interest in a timely fashion. Any special information is clearly stated to avoid delays or the possibility of missed holding times.

Sample Acceptance Policy

When a sample arrives, the sample acceptance policy is implemented by sample custodial personnel. Each sample must meet the following sample acceptance criteria or it is flagged to clearly indicate the nature and substance of the variation:

- A Chain of Custody including a unique sample identification, the date and time of collection, collector's name, preservation type, sample matrix and any special remarks concerning the sample or project;
- Proper and durable sample labeling including a unique sample identification;
- Use of appropriate sample containers and preservation;
- Adherence to specified holding times;
- Adequate sample volume to perform the necessary tests; and
- No signs of damage, contamination or leakage.

When the sample does not meet the sample acceptance criteria, ESC will:

- Retain correspondence and/or records of conversations concerning the final disposition of rejected samples; or
- Fully document any decision to proceed with the analysis of samples not meeting acceptance criteria.
- The condition of these samples will be noted on the COC and lab receipt documents.
- The analysis data will be appropriately "qualified on the final report.

In the event holding times are exceeded or improper preservations or containers are used, the client is notified immediately. If the client approves continuation of analyses, any non-conformances are clearly stated on the final report.

Sample Survey and Inspection

Upon arrival at the laboratory, a sample container's exterior is inspected and surveyed for damage or contamination. All shipping containers should be opened in a well-ventilated area. If hazardous materials are suspected, the container will be opened under a hood.

Prior to the removal of samples, absorbent pads should be laid out to receive sample bottles. The SC will note on the Sample Log-in Sheet the following:

- Condition of container, noting any damage, etc.
- Presence/absence of COC seals and their condition
- Sample condition (intact, broken, leaking, cold or ambient, headspace, surface contamination, etc.).
- Presence/absence of sample labels.
- Compare for agreement between sample labels and COC record.
- Samples that are not listed on the COC record will be noted and the client contacted.
- Odors noticed after opening the shipping container are noted.

Sample Log-in and Labeling

All sample information from the Chain of Custody is entered into the Laboratory Information Management System (LIMS). The SC will assign a unique eight digit laboratory log number to each sample. Laboratory sample numbering is comprised of a log number followed by -01 for the first sample, -02 for the second sample, etc. If there is more than one sample container per sample (i.e. one container preserved with nitric acid for metals and three VOA vials for volatiles), the individual containers will be labeled with the proper eight digit log number plus the two digit sample ID plus the a unique letter (A,B,C etc.) for each container. A durable label containing this laboratory ID number along with the proper preservative and analyses requested is placed on the sample container for identification throughout the entire analytical process. A file folder with the log number printed on it will be created to contain all the analytical information relevant to the project including: signed airbill, signed chain-of-custody, work sheets, raw data, QC reports, analytical report, etc.

Sample Splitting and Preservation

When clients supply their own containers or when bulk samples are received, the SC will split samples and preserve according to EPA requirements giving sufficient aliquots for each analytical procedure that is to be performed. SOP GEN_01 describes sample splitting procedures in greater detail.

- Water Samples – When samples arrive that require non-rad analyses, the SC will split and label the sample into appropriate containers.
- Sediment/Soil Samples – The sample will be made homogeneous after any portion has been removed by one or all the following procedures:
    - Stirring
    - Air drying and grinding
    - Particle separation
    - Quartering

Sample Storage, Custody and Security

Sample control is primarily the responsibility of the Sample Custodian and is maintained at ESC through the use of several tracking systems designed to protect sample integrity from login to disposal or return. Samples are placed in designated storage areas except during laboratory analysis. All laboratory personnel who receive samples are responsible for the care and custody of samples from the time each sample is received until samples are returned to storage. Any subset of the sample will be kept in a designated storage area which is controlled by the sample custodian. At the beginning of every work day all the sample storage areas are unlocked by laboratory personnel. At the end of every day the sample storage areas are locked, and the laboratory is locked with a continuously monitored alarm.

Complete details are outlined in SOP GEN_01.

Sample Disposal

Upon completion of the analysis, the samples are placed on an archive list. Once a month, the SC is responsible for collecting all samples on the archive list that have been completed 30 days or more unless other arrangements have been made. Completed samples and all remains are properly disposed of or returned to the client as necessary. Any sample considered hazardous or radioactive is returned to the client for disposal.

This procedure is fully described in SOP GEN_20.

8.0 EQUIPMENT

8.1 EQUIPMENT LIST

LABORATORY EQUIPMENT LIST: MAJOR ITEMS – Rad Lab
This table is subject to revision without notice

Title	QTY	Make	Model	Serial
Chemchek KPA-11 Kinetic Phosphorescence Analyzer w/ Gilson Sample Changer and Gilson Dilutor 401 Syringe Pump	2	Chemchek	KPA-11	1418986; 649025031; 91-5050024
Canberra 2404 Alpha/Beta Counter	5	Canberra	2404	1090352; 988600/787196;488584

Mercury Analyzer	1	Perkin Elmer	3030B	

8.2 EQUIPMENT MAINTENANCE

All equipment is properly maintained, inspected, and cleaned as an ongoing process according to SOP GEN_17.

Preventative Maintenance

ESC regularly performs preventative maintenance, such as checking fluid levels, to ensure that our equipment runs properly and smoothly with limited down time in accordance with SOP GEN_17.

Troubleshooting and Routine Maintenance

Troubleshooting begins with routine maintenance. It may be performed by ESC personnel or trained personnel from the manufacturer. A controlled log for maintenance is assigned to each instrument as well as for electrode(s). Each log is maintained by the analyst responsible for analytical performance with the particular instrumentation.

Equipment subjected to overloading or mishandling, which gives suspect results, or is proven to be defective will be placed out of service by the Laboratory Tag-Out System (GEN_05). When this occurs, previous calibrations and/or analyses are examined for any effect this may have had.

ESC has back up instrumentation to lessen down-time and ensure timely data delivery.

Equipment Checks

Equipment Check	*Frequency*
Analytical balances	Daily
Oven Temp	Daily
Frig Temp	Daily
Balance Calibration	Daily
DI Water Conductivity	Daily
Pipettes Calibrated	Quarterly
Electronic Pipets	Daily
Fire Extinguisher	Monthly/annual
Hood Velocity	Monthly
Survey Meters	Upon use/annual
Thermometers-liquid	Initial & annually
Thermometer gun	quarterly
Weights	Every 5 years
Air filters replaced	Monthly
Vacuum pump oil	Qtrly or as needed
Hood motors	Qtrly or as needed
Volumetric glassware	Initial/ as needed

8.3 INSTRUMENT CALIBRATION FOR RADIOCHEMISTRY

These and other points such as calibration and verification of reference standards can be found in the GEN_25 and method specific SOP's.

Initial Calibration

Sources used to determine detector efficiency are NIST traceable, prepared from NIST traceable or from a recognized entity such as EPA, DOE or IAEA.

Alpha Spectrometry prepared standards are to be checked by a material mass balance remaining from neodymium fluoride precipitation and rinses. Propagated uncertainties are to be determined.

Check sources are only to be used to verify calibrations and not used for efficiency determinations.

Instrument Calibration Verification

Daily source checks traceable to NIST or equivalent are used to monitor calibration. These sources are separate from the Initial calibration source. These sources are used to monitor counting efficiency, FWHM and energy calibration. Energy calibration is the only adjustment that can be made. Control charts are used to determine whether results are with control limits. Limits are 3σ outlier and 2σ warning.

Background Checks

Background count rates will be determined for each radiation detector system on a routine basis, for systems in regular use. A 1000 minute background count is performed monthly to determine the background subtraction count (BSC). Shorter background counts are performed on a daily basis to monitor contamination on detectors. Alpha Spectroscopy backgrounds are performed weekly. Where applicable, the results of these measurements will be recorded in a log and plotted on a control chart. Appropriate investigative and corrective action will be taken when the measurement value falls outside the pre-determined range of control values. For liquid scintillation counters the background sample is counted prior to samples and for the same count time.

Sample Introduction

For systems in which samples are changed manually, check sources are measured daily. For systems with automatic sample changers, it may be more convenient to include the check source within each batch of samples and thus obtain a measurement of this source within each counting cycle.

For proportional counting systems, the plateau will be checked annually at a minimum. Response to the check source will be checked daily or before each use and after each gas change. Background measurements will be daily or before each use, to ensure that background radiation levels are within the expected range. For systems with automatic sample changers, background or reagent blank measurements will be included within each measurement cycle.

Alpha & Gamma Spectrometers

For alpha and gamma-ray spectrometry systems, energy calibration sources will be counted to determine the relationship between channel number and alpha or gamma-ray energy. The frequency of energy calibration checks depends on the stability of the system, but usually is performed daily for gamma spec. and alpha spec. The results of these measurements will be recorded and compared to predetermined limits to determine whether or not system gain and zero level need adjustment. Adjustments will be made as necessary.

Additional checks needed for spectrometry systems are the energy resolution of the system and the count rate of a check source. These will be performed daily or before each use and after system changes, such as power failures or repairs. This is to determine if there has been any significant change in the system. The results of these measurements will be recorded when the system is in use.

8.4 INSTRUMENT CALIBRATION FOR INORGANICS

Initial Calibration – Inductively Coupled Plasma

Prior to use, the Inductively Coupled Argon Plasma (ICP) is calibrated for every element and every line to be used. A daily calibration with a minimum of five points. The lowest point on the curve must be at or less than the LOQ. The r2 (linear regression) must be greater than or equal to 0.995 to ensure that the instrument has been calibrated accurately.

Continuing Instrument Calibration – Inductively Coupled Plasma

Initial Calibration Verification (ICV) is analyzed immediately following the standards. The ICV is from a different source as the standards and the result of the ICV must fall within 10% of the true value. The Continuing Calibration Verification (CCV) is from the same source as the standards and is analyzed after every ten samples and also must fall within 10% of the true value.

Mercury Analysis

All samples and standards are prepared and analyzed under E.P.A. Method 245.1 or 7470A/7471A. A five point standard curve is used with the sixth point going through zero. The r2 (linear regression) must be greater than or equal to 0.995 to ensure that the

instrument has been calibrated accurately. Initial Calibration Verification (ICV) is analyzed immediately following the standards. The ICV is from a different source as the standards and the result of the ICV must fall within 10% of the true value. The Continuing Calibration Verification (CCV) is from the same source as the standards and is analyzed after every ten samples and also must fall within 20% of the true value.

9.0 LABORATORY PRACTICES

9.1 REAGENT GRADE WATER

ASTM Type II (DI) water is used in the laboratory for dilution, preparation of reagent solutions, and the final rinsing of glassware. It is free from interferences and other contaminants. After passing through two ion exchange canisters and one carbon filter canister, water purity is monitored by an indicator light at each outlet and at the filtration apparatus, and checked daily for conductivity.

9.2 GLASSWARE

Class A volumetric glassware is used by the laboratory for measuring trace constituents in organic and inorganic analysis. Laboratory contamination is minimized by using disposable beakers for digestion purposes when applicable. The Standard Operating Procedure GEN_15 for glassware and labware cleaning is followed to ensure the removal of all traces of parameters of interest and contaminants that could interfere with analysis.

10.0 ANALYTICAL PROCEDURES

10.1 A list of laboratory SOPs associated in the Radiochemistry Laboratory.

11.0 QUALITY CONTROL

NOTE: For specific guidance on each determinative method, including required quality control and specific state requirements/modifications, refer to the relevant laboratory standard operating procedure(s).

Method Blanks

A method blank is analyzed for each batch of 20 samples or less (5%) for each test method. ASTM Type II (DI) water is used in preparation of method blanks.

Standards

Reference standards will be used to determine counting efficiencies for specific radionuclides and calibration check standards for ICP, CV.Calibration Standards have to be certified by the National Institute of Standards and Technology (NIST),

Environmental Protection Agency (EPA) or suppliers who participate in measurement assurance activities with NIST.

Chemical Standards will be prepared using methods reflecting a state of the analytical art and materials of known purity. Commercial chemical standards used will be traceable to NIST or certified by the EPA. Physical Standards and measuring devices will have currently valid calibrations traceable to national standards, primarily NIST.

Calibration certificates, when available, will indicate the traceability to national standards of measurement and will provide the measurement results and associated uncertainty of measurement and/or a statement of compliance with an identified metrological specification. These records can be found in the Quality Assurance Department.

Where traceability to national standards of measurement is not applicable, ESC Lab will provide satisfactory evidence of correlation of results, for example by participation in a suitable program of inter-laboratory comparisons, proficiency testing, or independent analysis.

Determination of QC Limits

Control Charts are generated annually and reestablished after major changes for all analyses routinely performed and are used for trend analysis. Control limits are based on E.P.A. and DoD method recommendations and are +/- 3 times the standard deviation and the warning limits are +/- 2 times the standard deviation. If the control limits exceed the EPA/DoD control limits then the EPA/DoD control limits are used.

Method for Handling Outliers

The method for handling outliers is based on Quality Control, split, and Performance Evaluation Study Program samples. If a LCS sample fails to fall within control limits it will be reanalyzed. If the LCSsample proves to be within specifications, the group of samples the LCS represents will be reanalyzed. If the LCS remains outside control limits, the samples will be re-prepared along with a known standard to identify the problem and where in the process the problem may be occurring.

12.0 DATA COLLECTION, REDUCTION, VALIDATION, AND REPORTING

12.1 DATA COLLECTION

All bench chemists document sample preparation activities in laboratory notebooks. These serve as the primary record for subsequent data reduction. The Alpha/Beta counters generate printouts that are used for calculations generated by a computer or worksheets. The data for alpha and gamma spectrometry, ICP and CV analyses are generated by stand-alone computers. Results of each analysis are transcribed onto Excel spreadsheets specific to the particular analysis. Concentrations of the analytes found in

the analysis are expressed according to the required units, depending on the sample matrix.

Any manual integrations for ICP are documented in the raw data records to show a complete audit trail before and after the manual integration to permit reconstruction of the results. This requirement applies to all analytical runs including calibration standards and QC samples. The person performing the manual integration signs and dates each chromatogram and documents the rationale for performing manual integration (electronic signature is acceptable).

12.2 DATA REDUCTION

Gross Alpha/Beta Results – Calculations are performed on a spreadsheet which calculates the counting efficiency of each sample according to the amount of solids present on the counting planchet. Count times are determined according to the MDA required by the client.

Alpha Spectrometry Results – Calculations are based on the specific area of a target peak along with the addition of a tracer. The target isotope is determined by energy and tracer recovery. In some instances the tracer has to be determined using a gamma spectrometer instead of the alpha spectrometer.

Gamma Spectrometry Results – Calculations are performed for each isotope after its identification is determined. The activity of each isotope is determined using a calibration curve and the peak area of each isotope.

Uranium Analyzer Results – Calculations are performed on each sample by entering the sample aliquot and final volume into the KPA computer prior to analysis. The final results will be rounded to the nearest 0.1 ug/L or three (3) significant figures if the results are larger than 10.

Inductively Coupled Plasma (ICP) – Calculations are based upon the emission intensity given off at a certain wavelength. The final calculations are done by the computer system by comparing intensity of sample against the intensity of known standards.

Atomic Absorption Spectrometry (CV) – Calculations are based on the amount of photometric absorbance at a particular wavelength by a specific metal. The final calculation is done by a computer system by comparing absorbance of sample against the absorbance of known standards.

12.2 VALIDATION

All analytical data must undergo a multi-tiered review process prior to being reported to the customer. Data review is the process of examining data and accepting or rejecting it based on pre-defined criteria. These review steps are designed to ensure that reported data

is free from errors and any non-conformances are properly documented. Standard Operating Procedure GEN_3 addresses data review in detail.

12.3 REPORTING

The final report is generated when all sample analyses are completed, reviewed and approved. The procedure for analytical reporting is GEN_03.

Any discrepancies encountered during the analysis of the samples are to be stated in the Case Narrative. The Case Narrative will discuss any problems encountered during the routine analysis of the samples. The Case Narrative will be printed on lab letterhead as page one of the final report and will be paginated.

After issuance of the report, the lab report will remain unchanged. Material amendments to an analytical report after issue will be made only in the form of a further document, or data transfer including the statement Supplement to Analytical Report , or equivalent wording. Such amendments will meet all the relevant requirements of the TNI and DoD Standard.

13.0 RECORD KEEPING

SOP GEN_3 outlines the complete procedure.

All records, certificates and reports are stored safely and securely and are held in strict confidence. Records which are stored on electronic media are supported by the hardware and software necessary for their retrieval and have hard copy or write-protected backup copies. Access to archived information relating to project files on the LIMS is protected against unauthorized access or amendment. Access to other archived information is documented with an access log. Records are protected against fire, theft, loss, environmental deterioration, vermin and, in the case of electronic records, electronic or magnetic sources. Records are maintained or transferred according to the client's instructions in the event the laboratory transfers ownership.

All documents (data and records pertaining to the laboratory and its' quality system, customers, personnel or business transactions) are maintained for a minimum of 7 years. Drinking water is held for 10 years. Prior to destruction, ODEQ drinking water compliance and bioassay customers are notified.

14.0 REVISIONS

The Regulatory Affairs Department has an electronic version of this Quality Assurance Manual with tracked changes detailing all revisions made to the previous version. This version is available upon request. Revisions to the previous version of this appendix are summarized in the table below.

Document	**Revision**
Quality Assurance Manual Version 15.0 (Appendix XIII)	Appendix origination – Incorporated necessary elements in previous stand-alone quality manual with effective date of 1/18/16 to produce this appendix.

End of Document

APPENDIX B

Relevant Standard Operating Procedures (SOPs) and Field Forms

SOP 1

Soil Sampling and Logging

Introduction
This SOP describes the procedures for properly collecting, handling, and logging soil samples (when required). Method-specific sampling techniques are presented in the following SOPs:

SOP 2	Surface Soil Sampling
SOP 4	Test Pit and Excavation Soil Sampling
SOP 5	Direct-push Drilling Sampling
SOP 13	Field Instrument Calibration
SOP 17	Equipment Decontamination
SOP 20	Sample Handling and Documentation
SOP 39	XRF Field Screening

Equipment

Equipment needs will vary, depending on the sample collection or drilling method. Refer to the appropriate SOP listed above for method-specific equipment needs.

Procedures

Non-Sleeved Grab Samples
Immediately upon receiving the sample, either from the split spoon or backhoe bucket, the material will be screened with the appropriate direct reading instrument, such as a PID or XRF, and the reading will be recorded on the log form or in the field notebook. The portion of the sample collected for chemical analysis will be transferred immediately into the appropriate sample container using decontaminated equipment, new wooden tongue depressors, or by hand wearing new disposable chemical-resistant gloves. Avoid gravels and rock fragments when filling soil sample containers. If the sample is to be analyzed for volatile organics, the container will be completely filled with soil to minimize headspace. The container will be labeled appropriately following SOP 20 and immediately stored in an iced cooler to maintain a temperature of 4° Celsius.

Grab Samples Using Sleeves (auger drilling methodology)
When sampling for volatile compounds, the sample will be kept in the brass or plastic sleeves, and the sleeves will be handled with chemical-resistant gloves. The sample will be screened with the direct reading instrument by exposing the end of one sample tube to the instrument probe. The sample sleeve selected for chemical analysis will be packaged immediately by covering each end of the sleeve with Teflon™ tape and sealed with plastic caps. The sample sleeve will be labeled as described above and immediately stored in an iced cooler to maintain a temperature of 4° Celsius.

Grab Samples Using Sleeves (Direct-push drilling methodology)
The sample sleeve will be cut and the sleeves will be handled with chemical-resistant gloves. The sample will be screened with the direct reading instrument by removing a portion of the sleeve, exposing the soil to the instrument probe. The soil sample selected for

chemical analysis will be packaged immediately into laboratory-supplied soil jars, labeled as described above, and immediately stored in an iced cooler to maintain a temperature of 4° Celsius.

Composite Soil Samples

Composite samples will be prepared by placing equal amounts of soil in a stainless steel bowl or a clean plastic bag using a stainless steel spoon or by hand wearing new chemical-resistant gloves. The sample will be homogenized with a stainless steel spoon or gloved hand. The homogenized soil will be packaged in a laboratory-supplied sample container, labeled appropriately, and placed in an iced cooler to maintain a temperature of 4° Celsius.

Soil Logging

When a detailed log of soils is required by the Sampling and Analysis Plan, soil will be logged following the procedures outlined below. The level of detail for soil logging will depend on the Data Quality Objectives and intended use of the log information. A description of visual soil characteristics will be recorded for all soil samples. The soil description may include the following information (in the order listed below):

- Soil type according to unified soil classification system
- Color according to the Munsell color chart
- Grain size and roundness
- Percentage fines, sands, and gravels
- Presence of interbedding, and number and thickness of layers
- Description of odors, staining, or sheen
- Density or stiffness
- Relative moisture content

A description of soil types and various field tests for soil classification is given at the end of this SOP.

The following information will be recorded in the appropriate spaces provided on the sample log form:

- Depth of all drive samples;
- Sample interval submitted for laboratory analysis;
- Meter reading from direct-reading instrument (if applicable);
- Contacts between soil types.

In addition to logging soils, the geologist will record the occurrence of first water and the approximate static water level within each borehole. The reference point for all subsurface measurements will be included on all boring logs (i.e., feet below ground surface).

Decontamination

Strict decontamination procedures, as outlined in SOP 17, will be used to prevent cross-contamination of samples. Decontamination will be performed on non-disposable sampling equipment, including drilling equipment (e.g., auger barrel, split spoon) and hand tools (e.g., shovels, hand augers, etc.

When possible, samples will be collected using disposable equipment to avoid the need for decontamination.

Unified Soil Classification System (when required)

The following is an overview of classifying soil according to the USC system. The distinction between soil types is based on the percentage of fine vs. coarse material in a sample. This is easily done in a laboratory but involves a lot of guesswork in the field. The key is to be consistent. If you are fortunate enough to have samples submitted to a geotechnical lab for sieve analysis, check your field classifications against the laboratory results. This will help you estimate percentages in the field.

1) Distinguishing Coarse-grained from Fine-grained Soils:
   A) Determine if material is predominantly coarse grained (sand or gravel) or fine grained (silt or clay). Coarse-grained materials are those with more than 50% retained on a No. 200 sieve (very fine-grained sand or larger).

   B) If coarse-grained, determine if it is predominantly sand or gravel. Be aware that in the USCS system, pea gravel-size particles are considered "very coarse grained sand."

   C) Further classify material based on the amount of fines present. Roughly, no or very little fines is a SP or GP classification; slight amount of fines is a GP-GM or a SP-SM classification; much fines is a GM or SM classification. The following chart shows the breakdown for these classifications.

Classification of Coarse-grained Sands
>50% larger than No. 200 sieve

Percentage Fines	Soil Name	USC Designation
<5% Fines	Gravel	GP or GW[1]
	Sand	SP or SW[1]
5-12% Fines	Gravel with Silt or Clay	GP-GM or GP-GC
	Sand with Silt or Clay	SP-SM or SP-SC
>12%	Silty or Clayey Gravel	GM or GC
	Silty or Clayey Sand	SM or SC

[1] - The designation SW or GW means well sorted -not well graded (confusing for geologists). This is a condition not normally found in natural depositional environments and usually indicates engineered fill. Do not use this classification unless you think the material is specifically graded-engineered fill.

   D) If material is fine grained, determine if any coarse-grained materials are present. Note that all fine-grained materials have the same USC designation. Therefore, you must use both the name and the designation to adequately describe the soil. Use the following chart to classify fine-grained materials.

Classification of Fine-grained Soils
>50% passing No. 200 sieve

Percentage Coarse	Soil Name	USC Designation
<15% Coarse	Silt	ML, MH
	Clay	CL, CH
15-29% Coarse	Silt w/Coarse	ML, MH
	Clay w/Coarse	CL, CH
>29% Coarse	Sandy Silt	ML, MH
	Gravelly Silt	ML, MH
	Sandy Clay	CL, CH
	Gravelly Clay	CL, CH

2) Classification of Fine-grained Soils

A) Distinguish clay from silt. The following are field tests for determining if a material is clay or silt.

1) Dilatency (reaction to shaking)
Remove course-grained materials. Prepare a pat of moist soil with a volume of about 1/2 cubic inch. Add enough water if necessary to make the soil soft but not sticky. Place the pat in the open palm of one hand and shake horizontally, striking vigorously against the other hand several times. A clean fine-grained sand will rapidly show water on the surface and become glossy. When squeezed between fingers, the gloss disappears from the surface, the pat stiffens and finally cracks or crumbles. A very plastic clay will show little reaction to shaking and squeezing; an inorganic silt will react somewhere in between.

2) Dry strength (crushing characteristics)
After removing coarse-grained particles, mold a pat of soil to a 1/2-inch cube, adding water, if necessary. Allow to dry completely. Test the strength of the dry cube by crushing between fingers. The dry strength increases with increasing plasticity, with a plastic clay having high dry strength. An inorganic silt and silty fine-grained sands are similar. Fine sand feels gritty where silt has a smooth, flour-like feel.

3) Toughness (consistency near plastic limit)
The worm test: roll soil into a rope (or worm). A clay can usually be rolled to 1/8-inch diameter before it breaks.

B) CH vs. CL and MH vs. ML

C) Additional Characteristics

1) Relative Density (coarse-grained material)

Blows per foot	Relative Density
<4	very loose
4 - 10	loose
10 - 30	medium dense
30 - 50	dense
> 50	very dense

2) Consistency (fine-grained material)

Blows per foot	Consistency	Field Test
0 - 2	very soft	easily penetrated several inches with fist
2 - 4	soft	easily penetrated several inches with thumb
4 - 8	medium stiff	penetrated several inches by thumb with moderate effort
8 - 15	stiff	readily indented by thumb but penetrated only with great effort
15 - 30	very stiff	readily indented by thumbnail
> 30	hard	indented with difficulty by thumb nail

3) Relative Moisture

Moisture is measured relative to its optimum water content for compaction. Use the following descriptions:

Relative Moisture	Field Test
Dry	does not contain water.
Slightly Moist	damp, will not hold together.
Moist	soil will reach its maximum compaction under pressure.
Wet	contains excess moisture for compaction.
Saturated	below the water table.

SOP 2

Surface Soil Sampling

Introduction

This SOP describes the procedures for sampling surface soils from ground surface to 12 inches below ground surface. Samples may be collected with decontaminated hand tools.

Equipment

- Hand tools (e.g., shovels, spoons, etc.)
- Sample driver apparatus
  - Drive barrel
  - Brass sleeves
  - Rod and slide hammer
- Teflon™ tape and end caps to seal brass sleeves
- Laboratory-supplied sample containers if not using brass sleeves
- Decontamination Supplies
  - Buckets
  - Alconox Detergent
  - Distilled water
  - Scrub brush
- Direct Reading Instrument (PID and/or XRF)
- Tape Measure
- Log Forms/Field Notebook

Preliminaries

Soil sample locations will be determined from the project-specific work plan. If necessary, concrete coring will be arranged before mobilizing to the field.

Procedures

Soil will be collected and placed into laboratory-supplied sample containers with decontaminated hand tools or with a gloved hand. Coarse-grained soils, such as gravel and rock fragments, will be avoided whenever possible. To prevent loss of volatiles, soil will be packed tightly inside the sample container to minimize headspace.

If soil samples are being collected with a sample driver, brass sleeves will be placed inside the sample barrel and the sampler will be driven to the desired depth with the slide hammer. After the sample barrel is retrieved, the brass sleeves will be removed and the ends of each sleeve will be covered with Teflon™ tape and sealed with plastic caps.

Samples will be labeled appropriately and immediately stored in an iced cooler to maintain a temperature of 4° Celsius. The sample depths and locations will be measured and documented in the field notebook with the soil description.

SOP 4

Test Pit/Excavation Soil Sampling

Introduction

This SOP describes the equipment and procedures for collecting soil samples from test pits and excavations. Samples may be collected from the backhoe bucket or from the excavation wall, provided the excavation meets safe entry requirements.

Equipment

- Hand tools (e.g., shovels, spoons, etc.)
- Sample containers
- Decontamination supplies
  - Buckets
  - Alconox detergent
  - Distilled water
  - Scrub brush
- Direct reading instrument
- Tape measure
- Log forms/field notebook
- Laboratory-supplied sample containers

Preliminaries

Sample locations will be determined using the project-specific work plan. Arrangements will be made for the location of underground utilities using Blue Stakes. When necessary, a private locating service will be used for utilities that are not covered by Blue Stakes.

Procedures for Sampling from Backhoe Bucket

Soil within the backhoe bucket will be screened with the appropriate direct reading instrument and readings will be recorded in the field notebook. Soil samples selected for laboratory analysis will be collected from the backhoe bucket, taking care to avoid sloughed material and avoiding material that has been in direct contact with the backhoe bucket. Samples will be packed in laboratory-supplied containers to minimize headspace. Each sample will be labeled following SOP 20.

Procedures for Sampling Directly from Pit Wall (less than 5 feet deep)

A fresh surface will be scraped from the pit wall using decontaminated hand tools. The soil on the pit wall will be screened with a direct reading instrument and the reading will be recorded in the field notebook. A soil sample will be collected by either pushing a brass sleeve into the wall of the excavation, or by removing material with decontaminated hand tools or gloved hand and packing it into the sample container. To prevent loss of volatiles, the brass sleeve or sample jar should be packed full so that no headspace is present. Each sample will be labeled following SOP 20.

Decontamination

Strict decontamination procedures, as outlined in SOP 17, will be used to prevent cross-contamination of samples. Decontamination will be performed on non-disposable sampling equipment, including drilling equipment (e.g., auger barrel, split spoon) and hand tools (e.g., shovels, hand augers, etc.

SOP 5

Direct-push Drilling Sampling

Introduction

Direct-push drilling equipment will be used to advance shallow soil borings (generally 30 feet or less) to collect soil and groundwater samples and for sites where access restrictions prevent mobilization of a larger drill rig. Standard operating procedures for direct-push soil and groundwater sampling are described below.

Preliminaries

Direct-push drilling sample locations will be marked or staked in the field and coordinated with the Terracon project manager and, if necessary, the client's project manager. Blue Stakes utility clearance will be requested for each boring location prior to direct-push sampling. Borings will be located at least two feet from marked underground utilities.

All sampling equipment will be decontaminated according to SOP 17 prior to initiating drilling activities. This equipment includes all direct-push drill rods, samplers, and hand tools.

Direct-push Drilling Equipment and Procedures

Soil borings will be advanced and sampled using a hydraulic hammer mounted to a truck, van, three-wheeler, or small tractor. Each borehole will be started by hydraulically hammering steel drill rod with a disposable pointed steel end point into the ground. The borehole will be advanced in regular increments, available in varying lengths from 2 to 5-feet, by adding sections of flush-threaded drill rod to the drill stem already in the ground. No lubricants or additives will be used while advancing direct-push borings.

Soil Sampling Equipment

The following equipment will used to conduct soil sampling:

- Direct-push core samplers (supplied by the drilling contractor)
- New polybuterate sample liners (supplied by the drilling contractor)
- New sample liner end caps (supplied by the drilling contractor)
- Chemical-resistant gloves
- Appropriate personal protection equipment according to the HASP
- Sealable plastic bags
- Sample labels
- Laboratory-supplied glass soil sample jars and labels (optional)
- Stainless steel putty knife
- Stainless steel bowl and spoon
- Photoionization detector (PID)
- Cooler and ice
- Munsell color chart, if required
- Unified Soil Classification System (USCS) chart, if required

Soil Sampling

Samples will be collected as specified in the site-specific sampling plan. At a minimum, soil samples will be collected at regular intervals if lithologic information is needed. Each soil sample will be collected in a drill rod sampler lined with a clear polybuterate sample sleeve. The sampler will be attached to the drill rod, lowered to the sample interval, opened, and then hydraulically hammered into the subsurface.

Soil samples for laboratory analyses can be collected directly in the samples' sleeves or may be transferred from the sleeves to laboratory-supplied sample containers using decontaminated hand tools or by hand wearing new chemical-resistant gloves.

Soil Sampling Using the Driller's Sample Sleeves

The polybuterate sleeves may be used as sample containers, using the following procedure. After the sampler has been retrieved from the borehole, the sample shoe will be removed from the sampler and the soil contents will be sealed in a plastic bag for headspace analysis. If the sample shoe is empty, a small amount of soil will be removed from the portion of the liner immediately above the sample shoe. The soil will be allowed to equilibrate in the plastic bag for approximately 15 minutes. The headspace vapors inside the bag will be measured by pushing the PID tip through one side of the plastic bag into the headspace of the bag. The maximum PID reading over a 30-second interval will be recorded at the corresponding depth on the soil-boring log. Following headspace sample collection, soil will be removed from each end of the polybuterate liner for soil classification. If recovery is poor, the headspace sample will be used for soil classification after the headspace reading has been measured and recorded on the boring log. The polybuterate liner will be trimmed flush on each side to minimize headspace, and each end will be covered with Teflon tape. Each end of the liner will then be sealed tightly with polybuterate end caps. The sample will be labeled and immediately placed in an iced cooler to maintain a temperature of 4°C.

In general, the sample liner associated with the highest headspace reading will be submitted for VOC and semi-VOC analysis. If headspace readings are zero for all samples, odors, soil staining, and clay-rich (high sorption) lithology will be used as selection criteria.

Soil Sampling Using Laboratory-Supplied Soil Jars

The sample sleeve will be cut and the sleeves will be handled with chemical-resistant gloves. The sample will be screened with the direct reading instrument by removing a portion of the sleeve, exposing the soil to the instrument probe. The soil sample selected for chemical analysis will be packaged immediately into laboratory-supplied soil jars, labeled as described above, and immediately stored in an iced cooler to maintain a temperature of 4° Celsius.

Sample Selection Criteria for Laboratory Analysis

In general, the sample liner associated with the highest headspace reading will be submitted for VOC and semi-VOC analysis. If headspace readings are zero for all samples, odors, soil staining, and clay-rich (high sorption) lithology will be used as selection criteria.

Groundwater Sampling

To facilitate the collection of groundwater samples at sites where the water table is penetrated, a temporary well point will be installed in the direct-push borehole. After the water table has been encountered, the borehole will be advanced at least three more feet to ensure adequate sample volume. The well point may consist of either a three-foot long stainless steel screen drill rod attachment or slotted PVC screened in a similar interval. New tubing and well screens will be used for each well point. A peristaltic pump will be attached to the tubing to obtain groundwater samples by the following analyte order in the appropriate laboratory-supplied pre-preserved sample containers:

1) VOCs and BTEXN
2) Semi-VOCs
3) Total Petroleum Hydrocarbons
4) Oil and Grease
5) Filtered metals

Groundwater samples collected for dissolved metals analysis may be field filtered using in-line filters attached to the outlet tubing of the peristaltic pump or with Nalgene™ hand-pump filters.

The sample will be labeled and immediately placed in an iced cooler to maintain a temperature of 4°C.

Boring Abandonment

After all soil and groundwater samples have been collected, each soil boring will be backfilled with granular bentonite. Borings that were drilled through asphalt or concrete will be backfilled with granular bentonite to within six inches of the ground surface and the asphalt and concrete cores will be restored.

Demobilization

After the equipment has been rigged down and loaded, the site will be cleaned and restored as close to its original condition as possible. All sampling equipment will be decontaminated prior to mobilizing to the next direct-push drilling sample location.

SOP 10B

Monitoring Well Design and Installation (using direct-push drilling)

Introduction

This SOP describes procedures for the drilling and installation of shallow monitoring wells within the unconfined water table aquifer using direct-push drilling equipment. Site-specific conditions may warrant deviating from these standard designs. Field personnel should consult with the project manager and the work plan before deviating from the basic design.

Well Design

The typical well design to be used is intended to provide water samples of the upper 5-10 feet of the water-bearing zone. The well screens will be 10-feet long and will be set so that the top of the screen is at least two feet above the highest-observed water level.

Casing and Screen Materials

In general, well materials will be 1-inch to 2-inch-diameter, schedule 40, flush-threaded, PVC. All joints will be flush-threaded. The perforated zone will be constructed from machine slotted 0.010-inch or 0.020-inch slot screen. A six-inch long sump (silt trap) will be placed at the bottom of the screen. Depending on site conditions, well materials can vary, including different diameter casings, different schedule ratings for the PVC, etc.

Sand Pack

The sand pack material will be a commercially packaged, inert, non-carbonate, well rounded, sieved, product of clean, silica sand. In general, a sand of 16-40 to 10-20 mesh should be used with 0.020-inch slot well screen. The sand pack will be placed from the bottom of the boring up to 1 foot above the top of the screened section.

Bentonite Seal

A bentonite seal will be installed in the annulus above the sand pack to prevent grout from infiltrating into the screen and sand pack zone. Bentonite chips may be used for the seal if it is placed above the water table. Pellets should be used below the water table, as they have a higher density than the chips and will settle through the water better.

Annular Seal

Shallow wells (less than 20 feet of annulus above the bentonite seal) can be sealed with bentonite chips, which are hydrated in place with potable water. Wells that have a longer annular space should be sealed with a cement grout mix.

Drilling and Installation Methods

Drilling Equipment

Boreholes for monitoring wells will be installed using direct-push drilling equipment unless field conditions dictate otherwise. The inside diameter of the rods should be at least 1 inch larger than the outside diameter of the well casing to allow room for a filter pack and grout seal to be installed through the rods.

Borehole Drilling

The borehole for the well casing will be drilled using direct-push rods. No lubricants, circulating fluid, drilling muds, or other additives will be used during drilling.

During drilling, native soil samples will be retrieved in clear polybuterate sleeves within the direct-push rods. The collected samples will be logged per the sampling work plan requirements, which may include soil type (Unified Soil Classification), moisture, and color. Selected samples may be submitted for chemical and physical analysis if called for in the work plan.

Once the borehole has been drilled to the desired depth, the subcontractor will prepare to install the well. The drill rods will remain in the ground to ensure stability of the borehole during well construction.

Well Casing Installation

Clean chemical-resistant gloves will be worn by drilling personnel while handling the well screen and casing. All lengths of well casing and screen will be measured and recorded in the field log book prior to well installation.

Filter Pack Installation

The filter sand pack will be installed by slowly pouring silica sand through the direct-push rods as they are slowly removed from the borehole. By this procedure, the rods act as a tremie pipe and will prevent sand from bridging inside the rods. The level of sand pack inside the annular space will be continuously monitored. As the rods are pulled upward, the sand settles out through the bottom and additional sand pack will be added at the surface. By adding sand pack this way, the borehole will remain open and free from cave-ins, and the well casing will remain centered within the sand pack and the borehole.

Bentonite Seal Installation

After the appropriate amount of sand pack has been added and its depth verified, the remaining annulus will be sealed with bentonite. Once the desired thickness of bentonite is in place, the bentonite will be allowed to settle for approximately 30 minutes. The thickness of the bentonite seal will be verified and subsequently hydrated using potable water.

Flush-Mount Completion

After the grout has cured, the PVC well casing will be cut so that it is approximately three inches below the ground surface. The top of the PVC well casing will be sealed with a locking expandable well cap, or PVC cap, and an 8-inch flush-mount well vault will be installed at the surface with cement. The cement surface surrounding the vault cover will be slightly mounded to cause surface water to drain away from the well so that the well vault will not fill with water.

SOP 12

Groundwater Monitoring Well Sampling

Introduction

This SOP describes the equipment, criteria, and procedures that will be used to sample groundwater monitoring wells. Some deviations from this SOP may be necessary because of site-specific conditions.

Equipment

Below is a checklist of equipment for conducting groundwater sampling:

- Tools for opening well covers
- Keys to wells
- Water-level indicators
  - Dual-phase (if free product is suspected)
  - Single phase
- Positive displacement pump
- pH, conductivity, and temperature meters
- Standards for pH calibration
- In-line filters for metals samples
- Chemical resistant gloves
- Laboratory-supplied sample containers
- Iced cooler
- Field Notebook
- Chain of custody form
- Appropriate personal protection equipment according to HASP
- Photoionization detector (optional)
- Drum(s) for purge water containment
- Drum labels
- Permanent marker

Preliminaries

All equipment will be decontaminated as described in SOP 17 prior to initiating sampling. Equipment requiring calibration will be calibrated following manufacturer's recommendations prior to initiating sampling. If a well pump will be used, the operating condition of well pump will be checked prior to field mobilization.

Procedures

Upon arriving at each groundwater monitoring well, the well vault cover will be removed and the wellhead will be examined. Any signs of tampering will be recorded in the field logbook. The lock and well cap will then be removed from the well casing and depth to water and total depth will be measured.

Well Evacuation

To obtain a groundwater sample representative of natural aquifer conditions, at least three casing volumes will be evacuated from the well using a positive displacement pump, disposable bailer, peristaltic pump with new tubing, or other equipment per the sampling work plan. Non-disposable equipment will be decontaminated prior to use as described in SOP 17. Evacuated groundwater will be poured into a graduated 5-gallon bucket to keep track of the purge volume. If purge water cannot be discharged at the site, when the graduated bucket is full, the contents will be transferred into a 55-gallon drum. If the well does not recharge fast enough to permit the removal of three casing volumes, the well will be pumped dry and sampled as soon as it has sufficiently recharged.

Casing Volume Calculation

The well casing volume will be calculated to determine the purge volume required to obtain a groundwater sample representative of natural aquifer conditions. The following procedure will be used to calculate the total purge volume. Using the top of the north side of the inner well casing as a reference point, the depth to water (DTW) and total depth (TD) of the well will be measured using a water-level probe. The height of the water column will then be calculated by subtracting the depth to water from the total depth of the well (TD - DTW). Equation (1) below is used to calculate volume constants for wells with various casing sizes.

$$\text{Well Casing Volume} = \pi (\text{Casing Radius})^2 (7.48 \text{ gal/ft}^3) \quad (1)$$

where Casing Radius = the radius of the well casing in feet
7.48 gal/ft^3 = volume conversion constant
π = constant = 3.14

For a 2-inch diameter well casing: Casing Volume = (TD-DTW feet) (0.16 gallons/foot)
Total Purge Volume = Casing Volume x 3

For a 4-inch diameter well casing: Casing Volume = (TD-DTW feet) (0.65 gallons/foot)
Total Purge Volume = Casing Volume x 3

Stabilization Parameters

If required by the sampling work plan, groundwater stabilization parameters pH, temperature, and specific conductivity can be monitored during well purging to verify when the aquifer has stabilized and groundwater sampling can commence. Stabilization parameters will be measured at least four times; once every casing volume and immediately before sampling. All stabilization parameter measurements will be recorded in the field log book. The following guidelines are acceptable ranges for stabilization parameters:

- pH readings are consistently within 0.2 pH units;
- temperature is within 0.5˚C of the last reading;
- conductivity is within 10 percent of the last reading.

Groundwater Sample Collection

A complete set of laboratory-supplied sample containers will be prepared and labeled prior to collecting groundwater samples. A disposable bailer or low-flow peristaltic pump will be used to obtain groundwater samples by the following analyte order in the appropriate pre-preserved sample containers:

1) VOCs including BTEXN;
2) Semi-VOCs;
3) Total Petroleum Hydrocarbons;
4) Oil and Grease/TRPH;
5) Filtered metals.

All 40-milliliter containers will be filled so that no headspace is present in the container after the lid has been fastened. Groundwater samples collected for dissolved metals analysis may be field filtered using inline filters attached to the outlet tubing of a peristaltic pump or with a Nalgene™ hand-pump filter press. The labels for each groundwater sample will be double-checked and immediately placed in an iced cooler to maintain a temperature of 4˚C.

Purge Water Containment and Disposal

If required by the sampling work plan, purge water can be contained in labeled 55-gallon drums and stored onsite. At a minimum, drum labels will contain the following information:

- Site Identification
- Monitoring Well Identification
- Volume (Gallons) of Purge Water
- Terracon
- Terracon Project Manager (Name)
  6949 South High Tech Drive
  Midvale, UT 84047
  801-545-8500

The final disposition of the purge water will depend on groundwater analytical results and contract specifications.

Decontamination

All sampling equipment will be decontaminated according to SOP 17 before initiating sampling. If more than one well will be sampled, sampling equipment must also be decontaminated between wells.

Demobilization

After well sampling has been completed and all equipment has been decontaminated, each well will be capped and secured. Damaged equipment will be noted in the field logbook and labeled on the instrument.

SOP 13

Field Instrument Calibration

Introduction

This SOP describes the procedures for the use and calibration of the most commonly used field instruments. The use and calibration procedures are provided for the following field instruments:

- Photoionization detector/organic vapor monitor (PID/OVM)
- X-Ray Fluorescence (XRF) Multi-element Analyzer

Photoionization Detector

- Photoionization detector meter and filter screen
- Isobutylene span gas (100 ppm) and gas sample bag

Calibration Procedures

Calibration procedures will be performed, as specified by the manufacturer, each day prior to use.

X-Ray Fluorescence (XRF) Multi-element Analyzer

- XRF

Calibration Procedures

Calibration procedures will be performed, as specified by the manufacturer, each day prior to use. When the sampling work plan requires EPA Method 6200 sampling methods, the calibration requirement listed in EPA Method 6200 will be followed.

SOP 17

Equipment Decontamination

In order to reduce the risk of cross-contamination or transferring contaminants from areas of known contamination to known clean areas, decontamination of personnel and equipment is required. The decontamination procedures shall be established for each site based on the degree of hazard associated with the site and the amount of contact with hazardous materials resulting from site work. Final decontamination procedures shall be reviewed and approved by the Site Safety and Health Manager and included in the site-specific Health and Safety Plan (HASP). This procedure contains general decontamination protocols, suitable for most sites, although decontamination procedures will be reviewed on a site-by-site, contaminant-by-contaminant basis. Spent decontamination fluids will generally be considered non-hazardous waste and disposed accordingly, dependent on contaminant types present at a given site.

Decontamination Guidelines

Terracon uses a four-step decontamination procedure described below:

Step 1 Gross Contaminant Removal
This step consists of a removing gross materials by gloved hand and then scrubbing using a detergent solution and water and a stiff brush. Scrubbing will continue until visible contaminants are removed. The water will be changed as necessary, daily at a minimum.

Step 2 Alconox Wash
An Alconox wash will be prepared by mixing 1 to 1-½ tablespoons of Alconox per gallon of warm water. The water will be changed as necessary, daily at a minimum.

Step 3 Clear Water Rinse
A rinse with clear potable water. This water will be changed as necessary to ensure its purity, daily at a minimum.

Step 4 Distilled Water Rinse
Unused distilled water will be used as a final rinse for all decontamination procedures. The water may be poured or sprayed.

Decontamination Blanks to document the decontamination procedures will be collected if required in the sampling work plan.

SOP 20

Sample Handling and Documentation

Introduction

This SOP describes procedures to follow once soil, sediment, or water samples are collected to ensure that the samples are handled properly and that appropriate documentation is completed.

Sample Handling

Chemical resistant gloves will be worn during collection and initial handling of all samples. All samples will be promptly placed in an iced cooler to maintain a temperature of 4°C. Typically, samples selected for chemical analysis are delivered at the end of each day to the analytical laboratory. If they are not submitted to the laboratory on the same day collected, they will be stored in a refrigerator in a locked sample storage room at Terracon's office until transport and delivery to the laboratory in an iced cooler. Upon receipt of the samples, the laboratory will record the internal temperature of the sample transport coolers on the chain of custody record.

Documentation

Sample Identification and Labeling

Samples will be labeled following the specific labeling requirements set forth in the sampling plan or using labeling methods that identify the area from which they were collected and the depth.

Each sample sleeve or sample container will be immediately labeled with the following information:

- Project number
- Sample identification
- Sample depth
- Date and time collected
- Analyses requested
- Filtered or unfiltered (for water samples)

This information will also be recorded in the field notebook. An example sample label is provided as an attachment to this SOP

Chain of Custody

Chain of custody documentation will begin in the field for each sample submitted to the laboratory and will be maintained by laboratory personnel. Samples will remain in the possession of the sampler at all times, or in a locked facility until delivery to the analytical laboratory. A chain of custody form will be completed and will accompany each sample cooler to the analytical laboratory. An example chain of custody form is provided as an attachment to this SOP.

Field Book

Terracon field personnel will maintain a field log book to record all field activities. The field logbook will be a weather-resistant bound survey-type field book. All data generated during the project and any comments or other notes will be entered directly into the field logbook.

SOP 39

X-Ray Fluorescence (XRF) Field Screening

Introduction

This SOP describes one procedure used for screening soils or sediments for metals. Samples may be collected with a decontaminated hand tools, drive barrel, or gloved hand.

Equipment

- X-Ray Fluorescence (XRF) multi-element analyzer
- Resealable plastic bags
- Log Forms/Field Notebook

Preliminaries

Soil sample locations will be determined from the project-specific work plan. The XRF will be calibrated following SOP 13 prior to initiating sampling activities.

Procedures

In-Situ Screening Procedure

Secure faceplate to the XRF. Set on the ground at a 30 to 60 degree angle. Pull trigger until XRF beeps. XRF will be set to analyze for a pre-set amount of time. To change length of analysis time, see manufacturer's instructions. The amount of time the XRF requires to analyze the sample will vary, depending on the current age of the source.

Ex-Situ Screening Procedure

Soils or sediments to be screened ex-situ will be collected in new, thin, resealable plastic bags (do not use freezer bags or thick plastic bags) labeled with the sample name, date and time of collection, Terracon's project number, and the sampler's initials. Sufficient soils or sediments to fill approximately one-third to one-half of a gallon bag will be collected from each location. New latex or nitrile sampling gloves will be worn for each sample during collection and handling. The soils or sediments will be homogenized inside the bag by gloved hand, so that the XRF analyses represent the average concentrations of metals in the sample.

Once homogenized, the XRF will be used to screen the sample either through manufacturer-supplied thin plastic sample bags or using manufacturer-supplied sample cups.

- **manufacturer-supplied plastic bag:** Fill three new sample bags from the resealable homogenized bag. Remove the foam cup holder from the XRF sample tray and slide one of the sample bags into place. Set the XRF into the stand and depress the main trigger. After the pre-set sampling time, the XRF will beep and display the reading. Repeat with each of the three sample bags. The average of the three final readings will be used as the representative concentration. An alternative to using the manufacturer-supplied sample bags is to place the XRF directly on the homogenized resealable bag in three separate locations and take the readings directly.

- **manufacturer-supplied sample cup:** Prepare a sample cup by placing the bottom cap (cap with two or three holes) under the cylinder, then fill the cylinder with soil from the homogenized sample. Place the manufacturer-supplied plastic film tightly over the soil, and then place the top cap. Ensure that cap is placed tightly over sample. Place the sample cup in the manufacturer-provided tray and the XRF in the stand. Depress the main trigger. After the pre-set sampling time, the XRF beep and will display the reading.

Ex-Situ Screening Procedure (EPA Method 6200)

When required by the sampling work plan, XRF screening procedures should follow *EPA Method 6200: Field Portable X-Ray Fluorescence Spectrometry for the Determination of Elemental Concentrations in Soil and Sediment*.

E.1805
FIELD MEASUREMENT – SURFACE ELEVATIONS

Last Review or Revision: June 2010

Objective

The purpose of this procedure is to establish proper and accurate methods to be used when surveying elevations on environmental sites.

Background

On many environmental sites, the horizontal spacing of monitoring wells may be less than 100 feet. The hydraulic gradient between these wells may be less than 0.1 feet, which necessitates an accurate survey of the top of casing elevations to 0.01 feet. Inaccurate elevations in some cases could result in an inaccurate determination of groundwater flow direction.

Procedures

a) In performing an elevation survey of a site, the first task is to choose a benchmark (BM). The BM should be of a permanent nature, that will exist over time and will not change in elevation. When using a fire hydrant as a BM, do not use the operating plug or adjustment nut. The elevation on the operating plug can change after the fire hydrant is used. Poured-in-place concrete, sign foundations and hydrants will make a good BM. Attempt to identify a BM with a known elevation to USGS or another datum.

b) When setting up the level, the instrument person should first ensure that the tripod legs are stabilized and then the instrument can be leveled using the leveling screws. Instruments which are leveled using a bar level need to be turned at right angles and re-leveled until the instrument indicates level in all directions without adjustment. Instruments with a bull's eye level ordinarily need to be leveled once, but the instrument should be turned 360° to ensure that it is accurately leveled.

c) When using the level, the instrument person should be able to accurately read the rod to 0.01 feet. This entails limiting the distance of the shot so that this accuracy can be maintained. Windy conditions will affect accuracy, especially on shots made where the rod is extended beyond 15 feet in the air. If the instrument person has difficulty reading the rod due to the wind blowing and bending the rod, or because the rod person has difficulty holding the rod in a stable position, the instrument person has the responsibility of resetting to ensure an accurate shot.

d) Finally, the instrument person should perform a closed loop, utilizing balanced backsight and foresight distances. This requires shooting back to the point of beginning, usually the BM. Upon completion of the loop, the instrument person is responsible for immediately calculating the closure error. On a small site with no turning points, this consists of resetting the instrument, thus creating a turning point

and a loop. In these situations, the BM elevation should close with less than 0.01 foot difference. In situations where there are several turning points, the closure error should not be greater than 0.01 foot per 100 linear feet of surveyed distance.

E.3000
BULK SAMPLING OF SUSPECT ASBSETOS-CONTAINING MATERIAL (ACM)

Last Review or Revision: June 2010

I. PURPOSE

The purpose of this standard operating procedure (SOP) is to provide information on the hazards of asbestos and procedures to follow to sample suspect materials for laboratory analysis. The following guidelines contained in this document apply to Terracon personnel who engage in bulk sampling of suspect ACM and are designed to provide standardization with respect to sample collection. This procedure should ensure that potential asbestos-containing material samples are collected in a manner which allows for accurate analysis of the material and that sampling personnel are protected against potential asbestos fiber releases through controlled sampling techniques or appropriate personal protective equipment.

The objective of bulk sampling building materials and components suspected to contain asbestos is to characterize the items that contain asbestos in quantities equal to or greater than 1% or other contaent limit as specified by local or state guidelines. By characterizing the locations and quantities of asbestos-containing materials (ACM), exposure hazards can be greatly reduced.

II. BACKGROUND AND REFERENCE

Asbestos has been a common component used in several building materials because of its strength enhancing and fire resisting properties. However, asbestos has been recognized as a human carcinogen and respiratory hazard. Due to its health hazards, building inspections and asbestos bulk sampling is requested for schools and many public or commercial properties prior to building renovation or demolition activities. Therefore, identifying, locating and quantifying materials containing asbestos is essential in the effort to prevent worker exposure to asbestos and prevent environmental contamination.

As a consequence of inhalation of asbestos fibers, a body of federal and state regulations has been developed. Federal regulations pertaining to asbestos are included in AHERA (Asbestos Hazard Emergency Response Act) US EPA 40 CFR 763, Subparts E, F; NESHAP (National Emissions Standards for Hazardous Air Pollutants (EPA 40 CFR 61); OSHA Asbestos Standards (29 CFR 1910.1001 and 29 CFR 1926.1101), and ASHARA (Asbestos School Hazard Abatement Reauthorization Act). Many states and local authorities have additional requirements including state-specific licensing and certification.

Terracon will comply with applicable federal, state and local regulations when conducting asbestos-related services.

III. EQUIPMENT

The minimum equipment necessary to conduct bulk sampling of suspect materials, in addition to the personal protective equipment outlined below in the Health and Safety Section, is listed below.

- Utility Knife, Chisel, Hammer, Screwdriver, Coring Tool
- Duct Tape
- Sample Containers (preferably ziplock-style clear plastic bags)
- Sample Labels and Indelible Marker
- Spray Atomizer containing Detergent Amended Water, Paper Towels/Wet Wipes
- Spray Adhesive
- Roof Patch Kit (if necessary)
- Measuring Wheel
- Camera
- Flashlight
- Field ACM Sample Log

IV. CERTIFICATION

Individuals conducting asbestos sampling must have the certifications listed below. Copies of these certifications and licenses should be taken to the site during the sampling event.

- United States Environmental Protection Agency Building Inspector training (and refresher training, if applicable)
- Asbestos Inspector State-license for the state of the project location (where necessary)

In addition, Terracon requires company-based training courses and hands-on experience of employees prior to commencing asbestos-related field services. Each employee must also receive respirator training, be medically monitored and successfully pass a fit-test utilizing issued respirator(s).

V. HEALTH AND SAFETY

Asbestos has been recognized to cause asbestosis, cancer of the lungs and digestive tract and mesothelioma. Asbestosis is a lung disorder characterized by a diffuse interstitial (between cell) fibrosis. The onset of asbestosis probably depends upon the asbestos dust

concentration, the morphology of the fiber and length of exposure. Cigarette smoking is strongly implicated as a co-carcinogenic among asbestos workers.

Under the OSHA asbestos standards, the employer has an obligation to protect employees against exposure to asbestos fibers in excess of 0.1 fibers per cubic centimeter of air (0.1f/cc). Personnel engaged in asbestos-related activities (including building inspections) must be trained, medically cleared and fit-tested for respiratory protection. Therefore, enrollment in a medical surveillance program in compliance with the OSHA asbestos and respiratory protection standards is mandatory. Terracon employees are not permitted to engage in asbestos-related activities unless they are enrolled in the Terracon medical surveillance program and have been medically cleared for respirator use by a physician.

The following safety and health protocols apply to Terracon personnel who engage in asbestos-related services. The guidelines contained in this document are based upon potential health hazards from exposure to asbestos fibers and physical hazards which may be encountered on survey project sites. Field activities will be performed in accordance with the procedures outlined in this document and applicable federal/state health and safety regulations.

Terracon personnel will use professional judgment during sample collection to prevent exposure to other building occupants. If unauthorized personnel attempt to enter a sampling area which could reasonably pose a fiber release hazard, the inspector will curtail bulk asbestos sample collection activity and request that the individual(s) leave the work area. If unauthorized personnel refuse to leave the work area, immediately contact the Project Safety Officer and/or a client representative. Sample collection activities should recommence only after unauthorized personnel have left the work area.

In the event that minor amounts of suspect asbestos containing materials such as thermal system insulation, sprayed-on or trowled-on surfacing materials, ceiling texture, etc. are released during the course of sampling, sampling team members will immediately evacuate the area and don Level C personal protective equipment. The area of potential ACM release will then be approached and suspect materials will be thoroughly wetted with amended water, slowly and deliberately swept to a centralized pile, re-wetted, and containerized in heavy mil asbestos disposal bags. Affected surfaces will then be re-wetted and swabbed with clean cloths or paper towels. Used wipes will be disposed of as asbestos-containing waste.

In the event that large quantities of potential ACM is released during sample collection activities, personnel will immediately evacuate the area and notify the Project Safety Officer and the client representative. The Project Safety Officer will request that the area be sealed until a properly attired response team can be mobilized to the area with a high efficiency particulate air filter (HEPA) vacuum and other equipment necessitated by site conditions.

If suspect materials are in deteriorated condition and fiber release appears likely, or if sampling must be conducted overhead and/or above drop ceilings, personnel will upgrade to Level C personal protective equipment as itemized above. Level C personal protective

equipment should be donned before moving drop ceiling panels, attic access panels, etc. where friable fireproofing or thermal system insulation are known to be present.

The indicated personal protective equipment shall be mobilized to asbestos sampling project sites on each day of sample collection and utilized, if necessary:

- Tyvek (standard) protective coveralls
- Half face or full face air purifying respirator equipped with HEPA (P-100) cartridges
- Impermeable gloves (nitrile or latex).
- Tyvek boot covers or washable outer footwear

Additional Health and Safety protocols such as those established by the owner/operator of the project site and Terracon's company policy regarding ladder safety, confined space entry and electrical hazards shall be followed.

VI. SAMPLING HAZARDS

a. Elevated Surfaces

Asbestos building inspections may include roofing materials and ceiling spaces containing suspect ACM. Appropriate ladders or other suitable devices (e.g., manlifts) will be used for gaining access to elevated sampling locations. Ladders will be inspected prior to use. Spreaders will be fully extended on all step ladders and firmly positioned prior to use. Where footing is uncertain, a sample team member will hold or otherwise secure ladders while in use by another sample team member. Personnel must always face ladders during both ascent and descent. Extension ladders will not be positioned more than one-quarter of their working length from buildings, walls, etc. (4:1 pitch). Sample team personnel will not walk on steeply pitched roof surfaces and will not walk on low pitched roofing surfaces while wet. Remain on designated roof walkways wherever present. Terracon personnel will visually inspect roofs prior to beginning sample collection activities and will avoid all areas which appear to be structurally unsound.

b. Confined Space Entry

Terracon asbestos inspectors will not enter any pit, shaft, tunnel, etc. which has limited means of egress, the potential for an oxygen deficient or toxic atmosphere or which was not designed for human occupancy without first developing a written safety plan which includes a confined space entry permit and procedures. Readily accessible spaces such as pipe tunnels in which personnel may stand can be entered to a distance where continuous visual and verbal communication can be maintained with another sample team member.

Adequate portable lighting must be utilized during sample collection in tunnels and similar spaces. No Terracon or sample team member may attempt to walk through a pipe tunnel,

etc. beyond the sight of a stand-by team member unless written confined space entry procedures have been prepared for the project.

c. Electrical Contact Hazards

Personnel will remain cognizant of the location and condition of electrical wiring during the collection of bulk asbestos samples. A visual assessment of each work space will be made prior to sample collection and electrical contact hazards will be evaluated. Unguarded junction boxes, exposed wiring, knife switches, etc. will be avoided during the collection of bulk ACM samples, and coring tools will not be used in near proximity to electrical switches or receptacles.

VII. PROCEDURES FOR BULK SAMPLING OF SUSPECT ACM

The primary purpose of this section is to identify the methods and techniques of controlled sampling, sampling site control and use of appropriate personal protective equipment to protect Terracon personnel and members of the general public from exposure to asbestos fibers during sampling activities. Adherence to these procedures should enhance personnel safety during sample collection activities and aid in the suitability of samples for analysis. Field activities will be performed in accordance with the procedures outlined in this document and applicable federal/state health and safety regulations.

Protocols for inspection and bulk sampling are defined in AHERA regulations. These are applicable for any type of survey; for example, a school, an area prior to renovation, a building prior to demolition and inspections undertaken to rebut the OSHA presumption that certain materials contain asbestos.

An accredited Building Inspector must perform the inspection. A summary of AHERA sampling protocols is as follows:

1. Visually inspect the building interior and/or exterior and identify locations of suspect ACM. Identify homogenous areas of friable and non-friable suspect ACM. Document locations, condition, classification and estimated quantities of each suspect material. It is recommended to depict locations of materials on a building diagram and take photographs of sampled materials.

2. Touch each suspect ACM to determine its friablity.

3. Collect representative samples of suspect ACM. Terracon recommends a minimum of three (3) samples of each material be collected from each homogeneous area. However, specific materials may require additional samples such as surfacing material and insulation

as described below. Judgment should be used on the need for and quantity of additional sample collection.

Surfacing materials: Collect, in a statistically random manner, at least 3 bulk samples from each homogenous area of 1,000 sq. ft. or less, at least 5 bulk samples from each homogenous area that is greater than 1,000 sq. ft. but less than or equal to 5,000 sq. ft., and at least 7 bulk samples of each homogenous area larger than 5,000 sq. ft.

Thermal System Insulation (TSI): Collect, in a randomly distributed manner, at least three bulk samples from each homogeneous area of TSI; collect at least one bulk sample from each homogeneous area of patched TSI if the patched section is less than 6 linear or square feet; collect bulk samples from each insulated mechanical system where cement or plaster is used on tees, elbows, etc. in a manner sufficient to assess whether the material is ACM.

If fiber release appears likely, wet methods will be employed in the collection of suspect ACM samples. Water amended with a minimum of 10% commercially available window cleaning solution or other suitable surfactant should be used to moisten materials prior to sampling. Bulk asbestos samples will not be collected over the heads of, or in near proximity to, non-project personnel. Respiratory protection is not required when sampling non-friable suspect materials or materials below the breathing zone which are adequately wetted with amended water.

4. Bulk ACM samples should be immediately placed in sample containers and sealed while the materials are wet. If collecting samples of friable ACM or normally non-friable materials which are in deteriorated condition, precautions must be taken to prevent the release of fibers to the work area. Precautions include aggressively wetting the surface or potentially isolating the material (e.g. glove bagging) prior to disturbance.

5. Reusable sampling equipment will be gently rinsed with amended water. Dry the equipment with paper towels to be disposed of as contaminated materials.

6. The following decontamination sequence should be used following sample collection activities requiring Level C personal protective equipment:

- Remove coveralls slowly turning the outside inward.
- Place in heavy mil asbestos disposal bag.
- Remove gloves and shoe covers (if utilized)
- Remove respirator and carefully dispose of respirator cartridges in asbestos disposal bag.
- Securely seal protective clothing and any potentially contaminated disposable sampling equipment in heavy mil asbestos disposal bags.
- Do not smoke or eat with soiled hands.

- Wash hands, face and forearms thoroughly before eating, drinking smoking or using toilet facilities.
- Shower thoroughly as soon as possible upon leaving the project site.

7. Bulk sample analysis for asbestos content is performed by polarized light microscopy (PLM). The analytical testing procedure is based on U.S. Environmental Protection Agency (EPA) methods and National Voluntary Laboratory Accreditation Program (NVLAP) requirements. Terracon will use NVLAP accredited and appropriately licensed laboratories for analysis of asbestos bulk samples. Samples will be controlled with the analytical laboratory through chain of custody documentation.

E.4000
SAMPLING OF POTENTIAL LEAD-BASED PAINT

Last Review or Revision: June 2010

I. PURPOSE

The purpose of this standard operating procedure (SOP) is to provide information on the hazards of lead-based paint (LBP) and describe procedures for identificationand proper LBP sampling techniques. The following procedures for sampling potential LBP using a direct reading instrument and paint chip collection are designed to provide standardization with respect to location and number of samples collected and method of labeling sample locations. In addition, this procedure should ensure that potential LBP samples are collected in a manner which allows for accurate analysis of the material. Finally, this procedure will help to ensure that sampling personnel are protected against potential lead dust releases through controlled sampling techniques or appropriate use of personal protective equipment.

The objective of sampling coated (i.e., painted, pigmented or stained) surfaces for LBP (LBP) is to characterize materials and components that contain lead in surface coatings and compare them to established limits such as the Environmental Protection Agency (EPA) or Housing Urban Development (HUD) standards and guidelines such as at quantities greater than 1.0 milligram per square centimeter (mg/cm^2) or 0.5% by weight or other regulated quantity as specified by state or local authority. By characterizing the locations and quantities of LBPs, exposure hazards can be greatly reduced.

II. BACKGROUND AND REFERENCE

Lead is a toxic heavy metal which may cause blood, kidney and nervous system disorders if inhaled or ingested. Metallic lead and lead contained in dusts are not readily absorbed through the skin. However, skin contact with potentially contaminated site materials should be avoided.

The United States EPA and HUD have established an action level for LBP of 1.0 milligram per square centimeter (mg/cm^2) or 0.5% by weight. Coatings with quantities equal to or greater than these values are considered LBP. The Occupational Safety and Health Administration (OSHA) does not establish a LBP quantity but regulates the amount of lead that can become airborne and either inhaled or ingested by setting limits for air concentrations of 0.05 milligram per cubic meter (mg/m^3) of air over a work shift and blood values of 50 micrograms per deciliter of blood.

Lead was a common ingredient in paint until 1978 when the Consumer Product Safety Commission (CPSC) banned the sale of LBP for use in residences in quantities greater than 0.06% by weight. However, some industrial paints still contain lead today and are used in several applications. Lead can be introduced into the air by sanding or abrading surfaces containing LBP, and inhalation or ingestion of the dust is possible. Ingestion of lead can occur when children consume deteriorated paint chips, children place exposed toys or body parts into their mouths or when industrial workers exposed to lead-containing dust eat or smoke without washing their hands.

The lead content of paint can be determined with direct-reading instrumentation or by analysis of a bulk paint chip sample. An X-ray fluorescence (XRF) type analyzer is recommended to obtain direct readouts of lead content in coated surfaces. The XRF analyzes for lead by atomic absorption spectroscopy (AAS). Results are in milligrams of lead per square centimeter. Paint chip sample analysis is performed by inductively coupled plasma-atomic emission spectrometry (ICP-AES) in accordance with EPA SW-846 Method 6010B. Results are typically reported as lead percent per paint chip weight.

When sampling for LBP in buildings classified under the United States Department of Housing and Urban Development (HUD) or other child occupied-facilities (i.e., publicly and privately owned-housing, public buildings, daycares, etc.), procedures stated in the most current revision of the Department of Housing and Urban Development *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards Housing*, June 1995 revision will be used.

Lead is also regulated by the Occupational Safety and Health Administration (OSHA) and the EPA. Occupational exposure to lead occurring in the course of construction work, including maintenance activities, painting, renovation and demolition, is subject to OSHA standard (29 CFR 1926.62), Lead Exposure in Construction. Construction work covered by 29 CFR 1926.62 includes any repair or renovation activities or other activities that disturb in-place, lead-containing materials. Employers must assure that no employee will be exposed to lead at concentrations greater than 0.05 mg/m^3 averaged over an eight-hour period without adequate protection.

The Resource Conservation and Recovery Act (RCRA) provides the EPA with the authority to regulate the waste status of demolition or renovation debris, including lead-containing materials. Specific notification and testing requirements must be addressed prior to transporting, treating, storing or disposing of hazardous wastes. Lead containing wastes are considered hazardous waste under RCRA if Toxicity Characteristic Leachate Procedure (TCLP) results exceed 5 milligrams per liter (mg/L). EPA exempts from most RCRA requirements those generators whose combined hazardous waste generation is less than 100 kilograms (kg) per month.

III. EQUIPMENT

LBP analysis can be conducted by using a direct reading XRF analyzer or by collecting paint chip samples. Equipment necessary to conduct both methods is listed below.

For direct reading sampling:

- X-ray fluorescence (XRF) analyzer and accessories
- XRF result field log (optional if downloading software is used)

For paint chip sampling:

- Heating tool and extension cord
- Tape measure or template
- Chisel
- Chipping hammer or scraper (lead paint samples from metal structures)
- Face shield or chipping goggles
- Sample containers (preferably sturdy, clear plastic vials)
- Sample labels
- Laboratory chain of custody for paint chip sample analysis

IV. CERTIFICATION

Individuals conducting LBP inspection services should have the certifications listed below. Copies of these certifications and licenses should be taken to the site.

- EPA lead inspector and risk assessor certification
- As applicable, local- or State-licensed lead inspector/risk assessor (required for HUD projects)
- Manufacturer training certification for the XRF analyzer

V. HEALTH AND SAFETY

The OSHA personal exposure limit (PEL) for lead is 0.05 milligram per cubic meter (mg/m^3) and the action level is 0.03 mg/m^3. The primary route of exposure of lead is through inhalation of contaminated dusts or by accidental ingestion; however, collection of small sample volumes required for analysis is not expected to generate significant dust. Although, if painted surfaces are being disturbed and dust is generated in the vicinity, personnel will take protective measures as indicated below. Project activities may be conducted in Level D personal protective equipment modified as specified below.

- Lead sampling activities will be performed in Level D personal protective equipment to include standard work uniform, safety footwear and hard hat if overhead hazards are present.

- Protective goggles or a full face shield will be worn during chipping hammer operations.
- Protective gloves should also be worn during lead chip sampling to prevent abrasion and contact with site materials. Half face disposable dust/fume/mist respirators (3M 9920 "surgical style" masks) or half-face air purifying respirators equipped with HEPA filter cartridges will be worn if dusty conditions develop on-site.

Due to the potential of accidental ingestion when working in areas with lead dust, do not smoke or eat with soiled hands. Wash thoroughly before eating, drinking or smoking. Shower thoroughly as soon as possible upon leaving the site.

The XRF analyzer contains a radioactive source and should be transported and used according to the manufacturer's instructions. Personnel utilizing the equipment shall have the proper training and certifications required for use of the equipment.

VI. PROCEDURES FOR XRF ANALYSIS

1. Identify areas with coated or prepared surfaces. This includes building materials, components and fixtures finished with a coating such as paint, stain and varnish. Wallpaper can mask prepared surfaces and should be included in the survey. Some ceramic tiles have a lead-containing glaze and should also be assessed, particularly where required by state or local regulatory agencies.

2. Select appropriate materials and locations to be sampled. When sampling painted interior surfaces, representative samples must be obtained per client instruction or in general compliance with the most current revision of the Department of Housing and Urban Development *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards Housing*, June 1995revision.

3. Calibrate the XRF unit according to the manufacturer's instructions before and after the survey. This involves taking calibration sample readings from a known source provided by the manufacturer.

4. Conduct XRF sampling on selected surfaces. Document descriptions of each surface sampled on the XRF result field log or using the manufacture's software. Record results on the XRF result field log if software is not used.

If results yield 1.0 mg/cm^2 (inconclusive), then a paint chip sample should be collected using the applicable procedures indicated in the following section.

If results indicate the presence of lead in quantities greater than 1.0 mg/cm^2, it is recommended that a photograph depicting the material and location be taken.

VII. PROCEDURES FOR PAINT CHIP SAMPLING

1. Identify areas with prepared surfaces. This includes building materials, components and fixtures finished with a coating such as paint, stain and varnish. Wallpaper can mask prepared surfaces and these areas should be included in the survey.

2. Select appropriate materials and locations to be sampled. When sampling painted interior surfaces, representative samples must be obtained per client instruction or in general compliance with the most current revision of the Department of Housing and Urban Development *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards Housing*, June 1995revision.

3. A heating tool and chisel is recommended to collect representative samples of painted surfaces, but a knife, chipping hammer or paint scraper may also be used. Minimum force should be used to prevent the generation of dusts and particles. Wear protective goggles, abrasion resistant gloves and/or particulate respirator as appropriate to the task.

Check with the analytical laboratory you will use to determine minimum sample size required. A two square inch (2 in^2) sample is recommended for each sample. The sample size should be documented on the sample log. Some laboratories conducting toxic characteristic leaching procedures (TCLP) analysis may request up to ten grams (10 g) per sample. Lead-based paint samples must be removed down to the bare substrate to ensure each layer of paint has been collected. Use a brush or mini-vacuum to clean up residual material and place it in the sample container.

4. Assign a sample number to each sample collected. Affix a label or mark the sample container indelibly with a sample identification number. Seal the sample container securely. Document descriptions and locations of each surface sampled on a field log. It is recommended that a photograph depicting the material and location be taken.

5. Send results and chain or custody to an American Industrial Hygiene Association (AIHA) accredited laboratory for analysis.

Terracon Project No. 61177082
EPA Cooperative Agreement #96835701

Dear Mr. Matthes:

Terracon Consultants, Inc. (Terracon) is pleased to submit the enclosed Phase I Environmental Site Assessment (ESA) report for the above-referenced site. This assessment was performed in accordance with Terracon's Salt Lake County Brownfield Assessment Grant Bid Proposal, dated December 1, 2017 and Contract for Environmental Engineering Services No. 0000000772, dated February 2017. This assessment was conducted under EPA Cooperative Agreement #96835701 for the Hazardous Materials and Petroleum Substances grant.

We appreciate the opportunity to be of service to you on this project. In addition to Phase I services, our professionals provide geotechnical, environmental, construction materials, and facilities services on a wide variety of projects locally, regionally and nationally. For more detailed information on all of Terracon's services please visit our website at www.terracon.com. If there are any questions regarding this report or if we may be of further assistance, please do not hesitate to contact us.

Sincerely,
Terracon Consultants, Inc.

Tina Cheney
ESA Group Manager

APPENDICES

EXECUTIVE SUMMARY

This Phase I Environmental Site Assessment (ESA) was performed accordance with Terracon's Salt Lake County Brownfield Assessment Grant Bid Proposal, dated December 1, 2017, and Contract for Environmental Engineering Services No. 0000000772, dated February 15, 2017, and was conducted consistent with the procedures included in ASTM E1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. The ESA was conducted under the supervision or responsible charge of Tina Cheney, Environmental Professional who performed the site reconnaissance on December 13, 2017.

The Salt Lake County Brownfield Assessment Grant is funded with U.S. Environmental Protection Agency, Region 8 (EPA) Brownfields Hazardous Substances and Petroleum Assessment Cooperative Agreement #96835701.

Findings and Opinions

A summary of findings is provided below. It should be recognized that details were not included or fully developed in this section, and the report must be read in its entirety for a comprehensive understanding of the items contained herein.

Site Description and Use

The site is an approximately 0.34-acre parcel (Parcel ID #15-02-204-007). An approximately 6,000-square-foot industrial building occupies the site. An approximately 672-square-foot garage is present on the northwest side of the site. Paved parking areas are located to the east and north of the building. A small weedy area is present on the western boundary area. The building is currently vacant.

Historical Information

The site was residential from at least 1898 to the mid-1940s. The residences were demolished by the late 1940s and the current commercial building was constructed in 1956. The site building was originally occupied by an electrical supply company and then a wholesale upholstery business before Schovaers occupied the building in 1977. The site was operated as Schovaers until April 2017, and now the site is vacant.

The property to the north was undeveloped in 1898. By 1911 the property was residential, and remained until the 1960s. Crown Plating has occupied the property since 1965 to the current day. To the east was Jeremy Street, followed by undeveloped land from at least 1898 to the 1950s. By 1958 the current building was visible to the northeast, and used by Greater Mountain Chemical Company of Utah from at least 1962 to 1972, a soap company in 1977, Creed Laboratories in 1982, Chembrite in the 1990s, and Heritage Forge from at least 2009 to 2017. The properties to the south were residential from at least 1898. By 1911 a railroad line was present, followed by

residences. In 1962 a janitorial supply company was listed, a laundry parts repair was listed in the 1970s to 1990s, and then the property appear to have been used as auto repair since the 1990s. The west adjoining property was residential from at least 1898 to 1911. By 1937 the residences were demolished and the property was vacant until the current structure was built in 1969. The building has been occupied by Continental Industries of Utah carpet, Indico Distributing, floor coverings, Utah Paperbox Company, Uinta Urethane Recyclers, and most recently EPC International/Uinta Urethane Recyclers.

Records Review

The site was identified on the RCRA (Facility ID #UTD088325769) and Brownfields (Facility ID 199723) databases. A Phase I and Phase II report were identified in connection with the Brownfields listing and are discussed in Section 3.7. Soil and groundwater impacts were identified at the site, and represent a Recognized Environmental Condition (REC).

The north-adjoining facility was listed as the Crown Plating Company, Inc. RCRA small quantity generator and a Brownfields facility. Based on numerous violations in the mid-1980s to early 1990s due to the known improper disposal of 1,1,1, trichlororethane (TCA) on the property boundary, this RCRA listing represents a REC to the site.

Multiple other facilities were noted; however, the remaining facilities do not represent a REC to the site. Refer to Section 4.1 for more detailed information regarding the findings.

Site Reconnaissance

Based on the site inspection there was an air compressor, heating and cooling systems, a sump, pole mounted transformers, and pavement staining was observed. The sump and staining represent a REC to the site, based on the long-term use of the site as an electroplating shop and the known soil and groundwater contamination on the site.

Adjoining Properties

The site is adjoined to the north by Crown Plating, an electroplating facility, to the east by Jeremy Street, and Heritage Forge, a metal forge and decorative stone facility, and to the south by vehicle repair shops. An industrial warehouse adjoins the site to the west. The north-adjoining Crown Plating facility is a REC based on the regulatory information and known releases.

Significant Data Gaps

No significant data gaps were identified.

Conclusions

We have performed a Phase I ESA consistent with the procedures included in ASTM Practice E 1527-13 of the Schovaers Electronics facility located at 22 South Jeremy Street, Salt Lake City, Salt Lake County, Utah. The following RECs or Controlled RECs (CREC) were identified in connection with the site:

- **Impacts from north-adjoining property:** The north-adjoining property has documented improper disposal of TCA very near or on the property line. This identified release represents a REC to the site.

- **Long-term industrial use:** The site has been an electroplating shop for approximately 40 years. Evidences of releases from these industrial operations were widespread and included leaking and spilling. Historical solvent uses, RCRA hazardous waste storage and disposal, wastewater discharge system, and staining are considered part of the long-term industrial use REC at the site.

- **Soil and Groundwater impacts at the site**: Based on Terracon's Phase II ESA, dated February 8, 2016, sampling at the site identified soil impacts of hexavalent chromium concentrations above industrial and/or residential Regional Screening Levels (RSLs) in shallow soils across the site. Groundwater has been impacted by trichloroethene (TCE) above Maximum Contaminant Levels (MCLs) and/or Vapor Intrusion Screening Levels (VISLs), and hexavalent chromium below MCL and above the tapwater RSL.

Recommendations

Based on the scope of services, limitations, and conclusions of this assessment, Terracon recommends the following additional actions.

- An additional Phase II ESA to assess the vertical and horizontal extent of impacts to soils or groundwater at the site in order to develop cleanup planning documents for the site.

1.0 INTRODUCTION

1.1 Site Description

Site Name	Schovaers Electronics
Site Location/Address	22 South Jeremy Street, Salt Lake City, Salt Lake County, Utah
Land Area	Approximately 0.34 acres
Site Improvements	One approximately 6,000-square-foot warehouse building and one approximately 672-square-foot open shed.
Anticipated Future Site Use	Redevelopment for commercial use
Purpose of the ESA	Redevelopment of the site

The location of the site is depicted on Exhibit 1 of Appendix A, which was reproduced from a portion of the USGS 7.5-minute series topographic map. The site and adjoining properties are depicted on the Site Diagram, which is included as Exhibit 2 of Appendix A. Acronyms and terms used in this report are described in Appendix F.

1.2 Scope of Services

This Phase I ESA was performed in accordance with our contract for Environmental Engineering Services with Salt Lake County (Contract Number 00000000772, dated February 15, 2017). This assessment was conducted under EPA Cooperative Agreement #96835701 for the Hazardous Materials and Petroleum Substances grant and was conducted consistent with the procedures included in ASTM E1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. The purpose of this ESA was to assist the client in developing information to identify RECs in connection with the site as reflected by the scope of this report. This purpose was undertaken through user-provided information, a regulatory database review, historical and physical records review, interviews, including local government inquiries, as applicable, and a visual noninvasive reconnaissance of the site and adjoining properties. Limitations, ASTM deviations, and significant data gaps (if identified) are noted in the applicable sections of the report.

ASTM E1527-13 contains a new definition of "migrate/migration," which refers to “the movement of hazardous substances or petroleum products in any form, including, for example, solid and liquid at the surface or subsurface, and vapor in the subsurface.” By including this explicit reference to migration in ASTM E1527-13, the Standard clarifies that the potential for vapor migration should be addressed as part of a Phase I ESA. This Phase I ESA has considered vapor migration in evaluation of RECs associated with the site.

1.3 Standard of Care

This ESA was performed in accordance with generally accepted practices of this profession, undertaken in similar studies at the same time and in the same geographical area. We have endeavored to meet this standard of care, but may be limited by conditions encountered during performance, a client-driven scope of work, or inability to review information not received by the report date. Where appropriate, these limitations are discussed in the text of the report, and an evaluation of their significance with respect to our findings has been conducted.

Phase I ESAs, such as the one performed at this site, are of limited scope, are noninvasive, and cannot eliminate the potential that hazardous, toxic, or petroleum substances are present or have been released at the site beyond what is identified by the limited scope of this ESA. In conducting the limited scope of services described herein, certain sources of information and public records were not reviewed. It should be recognized that environmental concerns may be documented in public records that were not reviewed. No ESA can wholly eliminate uncertainty regarding the potential for RECs in connection with a property. Performance of this practice is intended to reduce, but not eliminate, uncertainty regarding the potential for RECs. No warranties, express or implied, are intended or made. The limitations herein must be considered when the user of this report formulates opinions as to risks associated with the site or otherwise uses the report for any other purpose. These risks may be further evaluated – but not eliminated – through additional research or assessment. We will, upon request, advise you of additional research or assessment options that may be available and associated costs.

1.4 Additional Scope Limitations, ASTM Deviations and Data Gaps

Based upon the agreed-on scope of services, this ESA did not include subsurface or other invasive assessments, vapor intrusion assessments or indoor air quality assessments (i.e. evaluation of the presence of vapors within a building structure), business environmental risk evaluations, or other services not particularly identified and discussed herein. Credentials of the company (Statement of Qualifications) have not been included in this report but are available upon request. Pertinent documents are referred to in the text of this report, and a separate reference section has not been included. Reasonable attempts were made to obtain information within the scope and time constraints set forth by the client; however, in some instances, information requested is not, or was not, received by the issuance date of the report. Information obtained for this ESA was received from several sources that we believe to be reliable; nonetheless, the authenticity or reliability of these sources cannot and is not warranted hereunder. This ESA was further limited by the following:

- The historical use of the site was not identified back to when the site was undeveloped, as the earliest ascertainable standard historical source identified the site as developed with residences in 1898. Based on the original non-suspect residential development of the site, this data gap is not deemed to be significant.

An evaluation of the significance of limitations and missing information with respect to our findings has been conducted, and where appropriate, significant data gaps are identified and discussed in the text of the report. However, it should be recognized that an evaluation of significant data gaps is based on the information available at the time of report issuance, and an evaluation of information received after the report issuance date may result in an alteration of our conclusions, recommendations, or opinions. We have no obligation to provide information obtained or discovered by us after the issuance date of the report, or to perform any additional services, regardless of whether the information would affect any conclusions, recommendations, or opinions in the report. This disclaimer specifically applies to any information that has not been provided by the client.

This report represents our service to you as of the report date and constitutes our final document; its text may not be altered after final issuance. Findings in this report are based upon the site's current utilization, information derived from the most recent reconnaissance and from other activities described herein; such information is subject to change. Certain indicators of the presence of hazardous substances or petroleum products may have been latent, inaccessible, unobservable, or not present during the most recent reconnaissance and may subsequently become observable (such as after site renovation or development). Further, these services are not to be construed as legal interpretation or advice.

1.5 Reliance

This ESA report is prepared for the exclusive use and reliance of Salt Lake County and Euclid, LC. Use or reliance by any other party is prohibited without the written authorization of Salt Lake County and Terracon Consultants, Inc. (Terracon).

Reliance on the ESA by the client and all authorized parties will be subject to the terms, conditions and limitations stated in the proposal, ESA report, and Terracon's Agreement. The limitation of liability defined in the Agreement is the aggregate limit of Terracon's liability to the client and all relying parties.

Continued viability of this report is subject to ASTM E1527-13 Sections 4.6 and 4.8. If the ESA will be used by a different user (third party) than the user for whom the ESA was originally prepared, the third party must also satisfy the user's responsibilities in Section 6 of ASTM E1527-13.

1.6 Client Provided Information

Prior to the site visit, Ruedigar Matthes, client's representative, was asked to provide the following user questionnaire information as described in ASTM E1527-13 Section 6. Mr. Justin Belliveau, of Euclid, LC, also completed the user questionnaire.

Client Questionnaire Responses

Client Questionnaire Item	Client Did Not Respond	Client's Response	
		Yes	No
Specialized Knowledge or Experience that is material to a REC in connection with the site.			X
Actual Knowledge of Environmental Liens or Activity Use Limitations (AULs) that may encumber the site.			X
Actual Knowledge of a Lower Purchase Price because contamination is known or believed to be present at the site.			X
Commonly Known or Reasonably Ascertainable Information that is material to a REC in connection with the site.		X	
Obvious Indicators of Contamination at the site.		X	

Mr. Matthes and Mr. Belliveau stated a Phase II was completed for the site that suggested there is contamination. Additional information about the report is in Section 3.7. Copies of the questionnaires are included in Appendix C.

2.0 PHYSICAL SETTING

Physical Setting Information		Source
Topography		
Site Elevation	Approximately 4,230 feet above sea level	USGS Topographic Map, Salt Lake City, North, Utah Quadrangle, 1963, photo-revised in 1969 and 1975 (Appendix A)
Topographic Gradient	Surface runoff and topographic gradient at the site is relatively flat.	
Closest Surface Water	The Jordan River is approximately half a mile west of the site.	
Soil Characteristics		
Soil Type	UL – Urban Land	Web Soil Survey http://websoilsurvey.nrcs.usda.gov
Description	Fill	
Geology/Hydrogeology		
Formation	Qtg – Terrace Gravels	Utah Geological Survey http://geology.utah.gov
Description	Pebble and cobble gravel, sand and silt occurring a few to several tens of meters above modern flood plains.	

Physical Setting Information		Source
Estimated Depth to Groundwater	10-12 feet	Terracon's Phase II, *Schovaers Electronics Facility*, dated February 8, 2016
Hydrogeologic Gradient	West, southwest	

3.0 HISTORICAL USE INFORMATION

Terracon reviewed the following historical sources to develop a history of the previous uses of the site and surrounding area, in order to help identify RECs associated with past uses. Copies of selected historical documents are included in Appendix C.

3.1 Historical Topographic Maps, Aerial Photographs, Sanborn Maps

Readily available historical USGS topographic maps, selected historical aerial photographs (at approximately 10 to 15 year intervals) and historical fire insurance maps produced by the Sanborn Map Company were reviewed to evaluate land development and obtain information concerning the history of development on and near the site. Reviewed historical topographic maps, aerial photographs and Sanborn maps are summarized below.

Historical fire insurance maps produced by the Sanborn Map Company were requested from EDR to evaluate past uses and relevant characteristics of the site and surrounding properties. EDR provided Sanborn maps as summarized below.

- Topographic map: Salt Lake City North, Utah, published in 1998 from **1997** aerial photographs
- Aerial photographs: EDR, **1937, 1946, 1950, 1958, 1962, 1965, 1971, 1977, 1981, 1993, 1997, 2003,** and **2014**; all photographs were scaled to 1"=500'. / Google Earth Historical Aerials, 2006, interactive scale
- Sanborn Fire Insurance Map(s): **1898, 1911, 1949, 1950, 1986**

Historical Topographic Maps, Aerial Photographs and Sanborn Maps

Direction	Description
Site	Residential development is visible (1898-1911). The residence on the south side has been demolished and the northern residence remains (1937-1946). The site is vacant (1949-1950). The current warehouse building occupies the site (1958-1981). A rail spur is visible along the southern section of the site, which terminates at the west boundary area of the site (1986-2009). The site is visible with the current warehouse and removed rail spur (2014).
North	The property appears undeveloped (1898). The property appears residential (1911-1962). The south section of the warehouse is present (1965-1981). The warehouse is expanded northward, comprising the current building configuration (1986-2014).

Direction	Description
East	Jeremy Street and undeveloped property is visible (1898-1952). Due east of the site, undeveloped property is visible. Northeast of the site, the current stone facility building is visible (1958-1981). Some small exterior storage is visible in the undeveloped area of the property. The current commercial building is still present (1993-2003). The property appears to be used as an exterior storage yard of stone and other products associated with the building north of the yard (2006-2014).
South	Residential property occupies the south-adjoining property (1898). A railroad line is present. Residential property is visible south of the rail line followed by residences (1911-1958). The rail line and residential property are visible (1962). The rail line and commercial buildings are visible (1965-2006). The rail line appears removed, and a vacant strip of property is visible, with commercial buildings present to the south (2014).
West	Residential property is present to the west (1898-1911). The property appears vacant (1937-1965). A commercial building occupies the property (1971-2014).

3.2 Historical City Directories

The R. L. Polk City Directories used in this study were made available through the Salt Lake City Public Library (selected years reviewed: 1946, 1952, 1957, 1962, 1967, 1972, 1977, 1982, 1987, 1993, 1999, 2005, 2009, and 2015) and were reviewed at approximate five-year intervals, if readily available. Since these references are copyright protected, reproductions are not provided in this report. The current street address for the site was identified as 22 South Jeremy Street.

Historical City Directories

Direction	Description
Site	**22 South Jeremy Street:** No listing (1946-1952). General Cable Corporation, electrical supplies (1962-1972). Keystone Brothers, wholesale upholstery (1977). Bob Schovaers Tactile Signs 7 Engraving (1999). Schovaers Electronics Corporation (1982, 1993, 2005-2015).
North	**8 and 14 South Jeremy Street**: No listing (1946-1962). Crown Plating, Inc. (1967-1982, 1993-2015).
East	**15 South Jeremy Street**: No listing (1946-1957). Greater Mountain Chemical Company of Utah (1962-1972). The Soap Company (1977). Creed Laboratories (1982). Chembrite, chemical products (1993-1999). No listing (2005). Alexander Clark Enterprises, ornamental metal work (2009-2015).
South	**42 South Jeremy Street**: Residential, sheet metal worker (1946-1952). Residential (1957). Rainbow Sales Company, janitorial supplies (1962). Western Broom Company (1967-1972). Laundry Equipment Parts, electrical repair (1977-1982, 1993-1999). Residential (2009). No listing (2005, 2015).
West	**25 South 900 West**: No listing (1946-1967). Continental Industries of Utah carpet (1972). Indico Distributing, floor coverings (1977). Utah Paperbox Company (1993). Uinta Urethane Recyclers (2005). EPC International/Uinta Urethane Recyclers (2009). No listing (1999, 2015).

3.3 Site Ownership

Based on a review of information obtained from the City or County assessor's records, the current site owner is Party of Six, LLC.

3.4 Title Search

County Deed Records were reviewed by of Texas Environmental Research of Rockwall, Texas, to obtain a chain-of-title for the site. Ownership records were reviewed back to 1939. Owners included individuals or individuals and their spouses until 1977, when ownership transferred to Schovaers Electronics Corporation. Schovaers Electronics Corporation transferred title to Party of Six, LLC on June 26, 2017. According to Mr. Schovaers they closed the Schovaers Electronics Corporation and transferred the title to the six Schovaers siblings. The title information is included in Appendix C.

3.5 Environmental Liens and Activity and Use Limitations

At the direction of the client, performance of a review of environmental liens and activity and use limitations was included as part of the scope of services, for which Terracon engaged Texas Environmental Research of Rockwall, Texas. Based on a review of the title provider's research, environmental lien and activity and use limitation records were not identified.

Additionally, the EDR regulatory database report included a review of both Federal and State Engineering Control (EC) and Institutional Control (IC) databases. Based on a review of the database report, the site was not listed on the EC or IC databases.

3.6 Interviews Regarding Current and Historical Site Uses

The following individual was interviewed regarding the current and historical use of the site.

Interviews

Interviewer	Name / Phone #	Title	Date/Time
Tina Cheney	Mr. Bob Schovaers (801) 521-2668	Owner/Owner Representative	December 13, 2017

Mr. Schovaers indicated they removed all chemicals and supplies from the building earlier in the year. Other than the previous Phase I and Phase II conducted on the site, Mr. Schovaers did not have additional information to provide to Terracon, other than they used limited quantities of chlorinated solvents for cleaning over the years. They would apply a small amount to a cloth for cleaning parts. He does not believe his facility has impacted the groundwater.

3.7 Prior Report Review

Terracon requested the client provide any previous environmental reports they are aware of for the site. Previous reports were provided by the client to Terracon for review.

- Phase I ESA
  22 South Jeremy Street
  Dated: June 2, 2015
  Prepared by: Terracon Consultants
  For: The Redevelopment Agency of Salt Lake City
- Phase II ESA
  22 South Jeremy Street
  Dated: February 8, 2016
  Prepared by: Terracon Consultants
  For: The Redevelopment Agency of Salt Lake City

The Terracon Phase I identified RECs with the site, including the north-adjoining property that had improper disposal of 1,1,1, trichlororethane (TCA) near the property line and the long-term industrial use of the site as an electroplating shop.

Terracon conducted a Phase II ESA to investigate the potential impacts to the sites soil and groundwater. Soil impacts included hexavalent chromium concentrations above industrial and/or residential EPA Regional Screening Levels (RSLs) in shallow soils across the site. Groundwater had been impacted by trichloroethene (TCE) in the western and northwest portion of the site above MCLs and/or VISLs, and hexavalent chromium below MCL and above the tapwater RSL. Further evaluation was recommended to address the impacts and planned use of the site.

4.0 RECORDS REVIEW

Regulatory database information was provided by GeoSearch, a contract information services company. The purpose of the records review was to identify RECs in connection with the site. Information in this section is subject to the accuracy of the data provided by the information services company and the date at which the information is updated. The scope herein did not include confirmation of facilities listed as "unmappable" by regulatory databases.

In some of the following subsections, the words up-gradient, cross-gradient and down-gradient refer to the topographic gradient in relation to the site. As stated previously, the groundwater flow direction and the depth to shallow groundwater, if present, would likely vary depending upon seasonal variations in rainfall and the depth to the soil/bedrock interface. Without the benefit of on-site groundwater monitoring wells surveyed to a datum, groundwater depth and flow direction beneath the site cannot be directly ascertained.

4.1 Federal and State/Tribal Databases

Listed below are the facility listings identified on federal and state/tribal databases within the ASTM-required search distances from the approximate site boundaries. Database definition, descriptions, and the database search report are included in Appendix D.

Federal Databases

Database	Description	Distance (miles)	Listings
BF	Brownfields Management System	0.5	10
SEMS (formerly CERCLIS)	Superfund Enterprise Management Systems	0.5	1
SEMS-ARCHIVE	Superfund Enterprise Management Systems Archived Site Inventory	0.5	4
DNPL	Delisted National Priorities List	1	0
EC	Federal Engineering Institutional Control Sites	Site	0
LUCIS	Land Use Control Information System	0.5	0
NFRAP	No Further Remedial Action Planned Sites	0.5	0
NLRRCRAG	No Longer Regulated RCRA Generator Facilities	0.125	0
NLRRCRAT	No Longer Regulated RCRA Non-CORRACTS TSD Facilities	0.5	0
NPL	National Priorities List	1	0
PNPL	Proposed National Priorities List	1	0
RCRAC	Resource Conservation & Recovery Act - Corrective Action Facilities	1	1
RCRAT	Resource Conservation & Recovery Act - Treatment Storage & Disposal Facilities	0.5	0

State/Tribal Databases

Database	Description	Distance (miles)	Listings
UTBF	Brownfield Properties	0.5	1
UTCERCLIS	CERCLIS Sites	0.5	5
UTICEC	Institutional Engineering Controls Registry	Site	0
UTLFSWDS	Landfill and Solid Waste Disposal Sites	0.5	0
UTLUST	Leaking Underground Storage Tanks	0.5	24
UTNPL	National Priorities List	1	1
UTRUST	Registered Underground Storage Tanks	Site and adjoining	1
UTTIERII	Tier II Facilities	Site	0
UTVCP	Voluntary Cleanup Program Sites	0.5	2

In addition to the above ASTM-required listings, Terracon reviewed other federal, state, local, and proprietary databases provided by the database firm. A list of the additional reviewed databases is included in the regulatory database report included in Appendix D.

The following table summarizes the site-specific information provided by the database and/or gathered by this office for identified facilities. Facilities are listed in order of proximity to the site. Additional discussion for selected facilities follows the summary table.

Listed Facilities

Facility Name and Location	Estimated Distance / Direction/Gradient	Database Listings	Is a REC, CREC, or HREC to the Site
Schovaers Electronic 22 Jeremy Street	Site	BF, RCRAGR08	REC discussed below
Crown Plating Company. 14 Jeremy Street	South-adjoining / cross- to down-gradient	BF, RCRAGR08	REC discussed below
Heritage Forge / Creed Laboratories 15 Jeremy Street	East-adjoining/ up-gradient	BF, RCRAGR08, RUST	No, file review discussed below
Bullough Insulation 50 South 800 West	Southeast-adjoining / 100 feet / cross-gradient	LUST	No, file review discussed below
Bullough Asbestos (former) 50 South 800 West	Southeast-adjoining / 100 feet / cross-gradient	CERCLA / SEMSARCH	No, file review discussed below

Schovaers Electronics

The site was identified on the RCRA small quantity generator (Facility ID #UTD088325769) and Brownfields (Facility ID 199723) databases. According to the regulatory database, this facility is a small quantity generator that generates fewer than 1,000 kg but more than 100 kg monthly of D000 class (unspecified), corrosive waste and lead. Files reviewed at the Division of Solid and Hazardous Waste indicated a compliance evaluation inspection was conducted on the facility in 1996. Based on the inspection by the Division of Solid and Hazardous Waste, the facility was found to be in violation of their hazardous waste storage. Drums were observed without "hazardous waste" or container content labels, without accumulation dates, and the drums were left open. The remaining violations consisted of records keeping in the facility. The facility was lacking a Contingency Plan, Personnel Training Plan, and Preparedness and Prevention Documentation. Compliance inspections were conducted at the facility again in 2009 and 2014, and no problems were noted (Appendix D). A Phase I and Phase II report were identified in connection with the Brownfields listing and are discussed in Section 3.7. Soil and groundwater impacts were identified at the site, and represent a REC.

Crown Plating Company, Inc

The north-adjoining facility was identified on the RCRAGR08 (Facility ID #UTD009086372), and Brownfields (Facility ID 199141) databases. Terracon reviewed the facility's regulatory files on record with the Division of Solid and Hazardous Waste. In the mid-1980s to the early 1990s, the

facility was inspected and found to be in violation of improper storage of materials, drums and containers lacking labels, corroding drums, unsealed drums and disposal of hazardous waste from the facility without hazardous waste manifests to verify proper disposal occurred. Inspections conducted during this time frame also documented the cluttered nature of the storage at the facility. The storage and disposal of sludge produced from the rinse baths at the facility and the use, storage, and disposal of spent 1,1,1-trichloroethane (TCA) and methylene chloride. The TCA and methylene chloride were used at the facility for degreasing purposes. The hazardous waste inspections conducted during this time frame indicated the TCA was being disposed of through evaporation and by pouring the spent degreaser on the ground on the southeast section of the property, immediately adjacent to the site.

Currently, the facility is classified as a small quantity generator. According to the most recent Compliance Evaluation Inspection conducted in December 2013, this facility produces approximately 600 to 700 pounds of sludge monthly. The sludge is classified as a hazardous waste due to the amount of chrome (hexavalent chromium) it contains. Approximately 20 gallons of methylene chloride, used as a paint stripper, is also produced monthly. No violations were noted in the most recent compliance evaluation.

Based on the violations noted in the inspections that occurred in the mid-1980s to the early 1990s, documented poor housekeeping practices, improper to absent drum labeling, and the improper disposal of hazardous waste onto the ground at the facility within 5 to 25 feet of the site's northern boundary line, this RCRA facility represents a REC to the site.

Creed Laboratories UST/Heritage Forge BF

The Creed Laboratories facility (Facility ID #4001520) formerly adjoined the site to the east. DERR records were limited; however, closure notice and closure plan documents for the facility indicated two 2,000-gallon diesel underground storage tanks were removed from the facility in September 1989. The closure plan noted one tank to contain diesel and the second tank to contain butyl CELLOSOLVE™, a glycol ether-based solvent. Two soil samples were collected at a depth during the closure and analyzed for total petroleum hydrocarbons and BTEX. Analytical results indicated constituents were not present above laboratory detection limits. Based on the clean closure and length of time since the UST closure, in Terracon's opinion, this listing does not represent a REC to the site.

The former Creed Laboratories, also known as Chembrite, was also identified as a RCRA Small Quantity Generator (Facility ID #UTD089326235) that produced more than 100 kg but less than 1,000 kg of hazardous waste monthly. Chembrite formulated, packaged, and sold cleaning agents and detergents. Although the regulatory database and the EPA Notification of Regulated Waste Activity form did not list what type of hazardous waste was produced at the site, informal notes in the regulatory files for the facility indicated some of the wastes produced included halogenated and non-halogenated solvents, including 1,1,1 trichloroethane (TCA). Several inspections by the DSHW occurred at the facility between 1985 and 1991. In the 1991 inspection, the DSHW noted the mixing vats were located over a floor drain, and overflow from the vats

discharged into this drain. Furthermore, it was noted a channel had been cut in the floor by unknown liquid in the vats; it was surmised to be a strong acid solution. Only one violation was noted against the facility, which was due to the failure to file a hazardous waste notification. The owner of Chembrite stated the facility did not generate or dispose of hazardous waste. Inspections conducted by the DSHW concurred with the owner, on the basis that the vats used in the production process of cleaning products and detergents were discharging into the sanitary sewer, which was approved by the City. However, in the last inspection, conducted in 1991, the DSHW recommended investigating the drains due to the questioning nature regarding proper connection of the drains to the sewer system. No follow-up investigation reports were in the file. The regulatory file was closed in 2001, indicating that the facility was no longer regulated by the DSHW. Terracon completed a Phase II discussed below that sampled for these chemicals of concern.

The Heritage Forge Brownfields listing (Facility ID 199141) identified a Phase I and Phase II reports prepared by Terracon, (Phase I ESA dated July 2, 2015 and Phase II dated January 6, 2016). The reports indicated the facility is a metal fabrication shop and stone production suppliers. The Phase I identified a REC, based on the long-term industrial used of the site as chemical laboratory and manufacturing facility, and the long-term use of chlorinated solvents. Sampling identified VOCs in one soil sample (HF-SB07) above screening levels, which was on the east side of the building, and in groundwater in five sample locations. VOCs were detected in HF-SB10 groundwater sample, on the northwest corner of the Heritage Forge property (approximately 230 feet northeast, cross to down-gradient from the site. VOCs were not detected in the groundwater in the other three samples collected along the west side of the Heritage Forge property. In addition, Terracon conducted a Phase II at the Schovaers site in November 2015 and groundwater impacts were not identified in any of the boring locations located in the eastern half of the site. Based on the sampling results reviewed and gradient, this facility does not represent a REC to the site.

<u>Bullough Insulation/Bullough Asbestos</u>

The LUST facility (Facility ID #4001968) had two underground storage tanks, one 4,000-gallon unleaded gasoline and one 3,000-gallon gasoline, and a dispenser removed from the facility in 1993. Analysis of the water collected from the tank pit area indicated TPH and BTEX concentrations were well below current ISL levels. The maps in the UST closure notice indicated the former tank pit area was located approximately 335 feet cross-gradient of the site. The site was closed by DERR in May 1995 through an internal memo. Based on the regulatory status, the minimal impacts present, the distance of the tank pit to the site and cross-gradient position of the facility with respect to the site, this former LUST facility does not represent a REC to the site.

This facility was also identified as the CERCLA / SEMSARCH facility (Facility ID # UTN000802419). According to the regulatory database and DERR records, a removal assessment was conducted by the EPA in August 2004. There were two structures located on the property: one long white building and one metal storage structure. Observations along the north side of the metal structure found several patches of asbestos insulation residue. Removal

of the substance was completed in October 2004, and facility records were archived in April 2006. Based on remedial efforts and type of contaminant, this former CERCLA SEMSARCH facility does not represent a REC to the site.

The remaining facilities listed in the database report do not appear to represent RECs to the site at this time based upon regulatory status, apparent topographic gradient, and/or distance from the site.

Unlocatable facilities are those that do not contain sufficient address or location information to evaluate the facility listing locations relative to the site. The report listed no facilities in the unlocatable section. Determining the location of unmapped facilities is beyond the scope of this assessment; however, none of these facilities were identified as the site or adjacent properties. These facilities are listed in the database report in Appendix D

4.2 Local Agency Inquiries

Agency Contacted/ Contact Method	Response
Salt Lake County Department of Environmental Health envhealthGRAMA@slco.org	According to Ms. Maxfield, no records of environmental concern were identified for the site.
DERR Interactive Map / http://enviro.deq.utah.gov/	Regulated facilities were identified on the DERR Interactive Map for the site and surrounding properties, and are discussed in Section 4.1. Incident reports were identified for the north, east, and southwest-adjoining properties. The incidences do not appears to have a significant impact on the site.
Salt Lake City / http://www.slcgov.com/recorder/request-record	According to Ms. Killinger there is an expired hazardous materials permit for the site.

5.0 SITE RECONNAISSANCE

5.1 General Site Information

Information contained in this section is based on a visual reconnaissance conducted while walking through the site and the accessible interior areas of structures, if any, located on the site. The site and adjoining properties are depicted on the Site Diagram, which is included in Exhibit 2 of Appendix A. Photo documentation of the site at the time of the visual reconnaissance is provided in Appendix B. Credentials of the individuals planning and conducting the site visit are included in Appendix E.

General Site Information

Site Reconnaissance	
Field Personnel	Tina Cheney
Reconnaissance Date	December 13, 2017
Weather Conditions	Cloudy, 30 degrees
Site Contact/Title	Bob Schovaer

Building Description				
Building Identification	**Building Use**	**Approx. Construction Date**	**Number of Stories**	**Approx. Size (ft²)**
Main Building	Office, vacant	1956	1	6,000
Garage	Personal storage	1965	1	672
Site Utilities				
Drinking Water	Salt Lake City Corporation			
Wastewater	Salt Lake City Corporation			
Electric	Rocky Mountain Power			
Natural Gas	Dominion Energy			

5.2 Overview of Current Site Occupants

The site has a 6,000-square foot office/warehouse, and a 672-square foot open shed. There is an office in the building, and the warehouse has been cleared of all supplies and chemicals.

5.3 Overview of Current Site Operations

None. The facility is currently vacant.

5.4 Site Observations

The following table summarizes site observations and interviews. Affirmative responses (designated by an "X") are discussed in more detail following the table.

Site Characteristics

Category	Item or Feature	Observed or Identified
Site Operations, Processes, and Equipment	Emergency generators	
	Elevators

	Exterior pipe discharges and/or other effluent discharges	
Other Notable Site Features	Surface water bodies	
	Quarries or pits	
	Wastewater lagoons	
	Wells	

Site Operations, Processes, and Equipment

Air compressor

One air compressor was observed in a small lean-to building on the northern exterior wall of the site building. The air compressor was stored on asphalt-paved surfaces. Staining was noted on the compressor and on the asphalt paving. Due to the limited source and generally non-hazardous nature of compressor oil, this staining represents a *de minimis* condition to the site

Heating and/or cooling systems

The facility is heated by natural gas hanging units in the warehouse. The office space is heated and cooled with a roof mounted system. No RECs were identified with the heating and cooling systems at the site.

Underground Chemical or Waste Storage, Drainage or Collection Systems

Sumps, cisterns, catch basins and/or dry wells

A sump is located in southeast section of the plating room, next to the former wastewater treatment system. The sump was used to capture the spilled solution from the plating tanks, which was then pumped to the waste water treatment system. The water from the sump is piped into the wastewater treatment facility where the metals are filtered out of the water. Treated water is then discharged into the sanitary sewer system. Based on the age of the sump (~40 years) compromises to the system are possible; therefore, the presence of the sump and wastewater treatment system is part of the long-term industrial use REC noted for this property.

Electrical Transformers/PCBs

Transformers and/or capacitors

During Terracon's site visit, three pole-mounted transformers, owned and serviced by PacifiCrop, were observed on the northern property boundary; however, no information with regard to PCB content of the transformer fluids was observed. Some transformers contain mineral oil which may contain PCBs.

PacifiCrop, maintains responsibility for the transformers, and if the transformers were "PCB contaminated," utility PacifiCrop, is not required to replace the transformer fluids until a release is identified. However, evidence of current or prior releases was not observed in the vicinity of the electrical equipment during the site reconnaissance.

Releases or Potential Releases

Stained pavement or similar surfaces

Staining was observed in the plating room section of the site. Based on the amount of staining, duration of operations and poor condition of the pavement, the stained pavement represents an REC to the site.

Dumping or disposal areas

During the site inspection in 2015, Mr. Schovaer mentioned to Terracon that in the early 1980s etchant was visibly seeping out of the building's southern exterior wall. Historically, a loading platform for the rail spur that entered the property was present along the southern wall. Due to this, the concrete slab for the building is elevated approximately three feet from ground surface. Due to the visible seepage in the early 1980s, Mr. Schovaers installed a floor lining in the plating room. The extent of the release is unknown. The known release of the etchant with its associated metals is part of the long-term industrial use REC noted for this property.

6.0 ADJOINING PROPERTY RECONNAISSANCE

Visual observations of adjoining properties (from site boundaries) are summarized below.

Adjoining Properties

Direction	Description
North	Crown Plating (8 and 14 South Jeremy Street) adjoins the site to the north
East	Jeremy Street and Heritage Forge Inc. (15 South Jeremy Street) adjoins the site to the east
South	Liberty Auto Work (42 South Jeremy Street) adjoins the site to the south, across the former railroad tracks
West	EPC International Warehouse (25 South 900 West) adjoins the site to the west

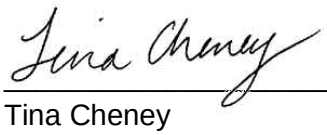
RECs were not observed with the adjoining properties.

7.0 ADDITIONAL SERVICES

Per the agreed scope of services specified in the proposal, additional services (e.g. asbestos sampling, lead-based paint sampling, wetlands evaluation, lead in drinking water testing, radon testing, vapor encroachment screening, etc.) were not conducted.

8.0 DECLARATION

I, Tina Cheney, declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in Section 312.10 of 40 CFR 312; and I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the site. I have developed and performed the All Appropriate Inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.



Tina Cheney
ESA Group Manager

APPENDIX C
HISTORICAL DOCUMENTATION AND USER QUESTIONNAIRE

Client/User Required Questionnaire

Terracon

Person Completing Questionnaire	Name: Rudigan Matthes Company: Salt Lake County	Phone: 385-468-4868 Email: RMatthes@slco.org
Site Name	Schovaers Electronics	
Site Address	225 Jeremy St. SLC, UT [redacted]	
Point of Contact for Access	Name: ~~Justin Bellis~~ Bob Schovaers Company: Schovaers Electronics	Phone: 801 943 3569 Email: bonschovaers@aol.com
Access Restrictions or Special Site Requirements?	X No ___Yes (If yes, please explain)	
Confidentiality Requirements?	X No ___Yes (If yes, please explain)	
Current Site Owner	Name: Bob Schovaers Company: Schovaers Electronics	Phone: 801 943 3569 Email: bonschovaers@aol.com
Current Site Operator	Name: Company: Vacant	Phone: Email:
Reasons for ESA (e.g., financing, acquisition, lease, etc.)	Acquisition	
Anticipated Future Site Use	Undetermined	
Relevant Documents?	Please provide Terracon copies of prior Phase I or II ESAs, Asbestos Surveys, Environmental Permits or Audit documents, Underground Storage Tank documents, Geotechnical Investigations, Site Surveys, Diagrams or Maps, or other relevant reports or documents.	

ASTM User Questionnaire

In order to qualify for one of the Landowner Liability Protections (LLPs) offered by the Small Business Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"), the user must respond to the following questions. Failure to provide this information to the environmental professional may result in significant data gaps, which may limit our ability to identify recognized environmental conditions resulting in a determination that "all appropriate inquiry" is not complete. This form represents a type of interview and as such, the user has an obligation to answer all questions in good faith, to the extent of their actual knowledge.

1) Did a search of recorded land title records (or judicial records where appropriate) identify any environmental liens filed or recorded against the property under federal, tribal, state, or local law (40 CFR 312.25)?
X No ___Yes ___Title search not completed (If yes, explain below and send Terracon a copy of the Chain of Title report.)

2) Did a search of recorded land title records (or judicial records where appropriate) identify any activity and use limitations (AULs), such as engineering controls, land use restrictions, or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state, or local law (40 CFR 312.26)?
X No ___Yes ___Title search not completed (If yes, explain below and send Terracon a copy of the Chain of Title report.)

3) Do you have any specialized knowledge or experience related to the site or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the site or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business (40 CFR 312-28)?
X No ___Yes (If yes, explain below)

4) Do you have actual knowledge of a lower purchase price because contamination is known or believed to be present at the site (40 CFR 312.29)?
X No ___Yes ___Not applicable (If yes, explain below)

5) Are you aware of commonly known or reasonably ascertainable information about the site that would help the environmental professional to identify conditions indicative of releases or threatened releases (40 CFR 312.30)?
___No X Yes (If yes, explain below) Phase II ESA (2015)

6) Based on your knowledge and experience related to the site, are there any obvious indicators that point to the presence or likely presence of contamination at the site (40 CFR 312.31)?
___No X Yes (If yes, explain below)

Comments or explanations:
Phase II suggested contamination.

Radius Report

Satellite view

Target Property:

Schovaers Electronics
22 Jeremy St
Salt Lake City, Salt Lake County, Utah 84104

Prepared For:

Terracon Consultants-Salt Lake City

Order #: 98336
Job #: 215459
Project #: 61177082
Date: 12/15/2017

Table of Contents

Disclaimer

This report was designed by GeoSearch to meet or exceed the records search requirements of the All Appropriate Inquiries Rule (40 CFR §312.26) and the current version of the ASTM International E1527, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process or, if applicable, the custom requirements requested by the entity that ordered this report. The records and databases of records used to compile this report were collected from various federal,state and local governmental entities. It is the goal of GeoSearch to meet or exceed the 40 CFR §312.26 and E1527 requirements for updating records by using the best available technology. GeoSearch contacts the appropriate governmental entities on a recurring basis. Depending on the frequency with which a record source or database of records is updated by the governmental entity, the data used to prepare this report may be updated monthly, quarterly, semi-annually, or annually.

The information provided in this report was obtained from a variety of public sources. GeoSearch cannot ensure and makes no warranty or representation as to the accuracy, reliability, quality, errors occurring from data conversion or the customer's interpretation of this report. This report was made by GeoSearch for exclusive use by its clients only. Therefore, this report may not contain sufficient information for other purposes or parties. GeoSearch and its partners, employees, officers And independent contractors cannot be held liable For actual, incidental, consequential, special or exemplary damages suffered by a customer resulting directly or indirectly from any information provided by GeoSearch.

Target Property Summary

Target Property Information

Schovaers Electronics
22 Jeremy St
Salt Lake City, Utah 84104

Coordinates
Area centroid (-111.91574, 40.7686468)
4,226 feet above sea level

USGS Quadrangle
Salt Lake City North, UT

Geographic Coverage Information

County/Parish: Salt Lake (UT)
ZipCode(s):
Salt Lake City UT: 84101, 84103, 84104, 84116

Radon
* Target property is located in Radon Zone 2.
Zone 2 areas have a predicted average indoor radon screening level between 2 and 4 pCi/L (picocuries per liter).

FACILITY INFORMATION

GEOSEARCH ID: **UTD980667240**
DERR ID: **UTD980667240**
FACILITY NAME: **UTAH POWER AND LIGHT AMERICAN BARREL CO.**
ADDRESS: **600 W SOUTH TEMPLE**
SALT LAKE CITY, UT 84101
COUNTY: **SALT LAKE**
PROJECT MANAGER: **CHAD GILGEN**
CONTACT PHONE: **8015364237**
PROJECT DESCRIPTION: **UPDATE 01-08-09:SITE IS A SMALL SLIVER OF LAND JUST SOUTH OF THE NORTH TEMPLE OVERPASS, BETWEEN 500 AND 600 WEST. RAILROAD TRACKS SLICE THROUGH THE PROPERTY.SITE WAS INITIALLY DISCOVERED BY LOCAL GRADE SCHOOL CHILDREN AS AN ATTRACTIVE NUISANCE DUE TO THE THOUSANDS OF EMPTY AND PARTIALLY EMPTY BARRELS ON THE GROUND. AMERICAN BARREL WAS THE NAME OF THE COMPANY THAT STORED, RECYCLED, AND RECONDITIONED 55-GALLON DRUMS OR BARRELS. THE 7-ACRE SITE WAS STORING THOUSANDS OF BARRELS IN VARIOUS CONDITIONS IN ROW AND ROW OF DRUMS PILED SEVERAL BARRELS HIGH. ONCE AN INVESTIGATION BEGUN, IT WAS DISCOVERED THAT THE SITE HAD ALSO ONCE BEEN THE LOCATION OF AN EARLY MANUFACTURED GAS PLANT IN THE LATE 1800S AND EARLY 1900S. DURING THE RI/FS STAGE, CONTAMINATION SUCH AS TARRY WASTES AND PAHS WERE FOUND AT DEPTH. CONTAMINANTS FROM THE PARTIALLY EMPTY/FULL BARRELS CONSISTED OF A WIDE RANGE OF HAZARDOUS CHEMICALS SUCH AS MALATHION, SODIUM CHROMATE, TRICHLOROETHANE, VARIOUS DEGREASERS, AND SOLVENTS. THESE CONTAMINANTS WERE GENERALLY CONFINED TO THE UPPER FEW INCHES OF THE SURFACE SOIL LEAD WAS ALSO FOUND IN THE SURFACE SOILS, PROBABLY RELATED TO THE NEARBY RAILROADS USING LEAD-CONTAMINATED SOILS IN THE AREA.THE BARRELS WERE REMOVED AND THE SITE NPL LISTED. UTAH POWER AND LIGHT WAS THE MAIN PRP SINCE THEIR PARENT COMPANY HAD OPERATED THE MANUFACTURED GAS PLANT. UPON COMPLETION OF THE RI/FS, IT WAS DECIDED TO EXCAVATE THE CONTAMINATED SOILS AND DISPOSE OF THEM, AND TO ADDRESS THE CONTAMINATED GROUNDWATER VIA NATURAL ATTENTION AND SOIL VAPOR EXTRACTION (SVE). EXCAVATION CLEANUP OCCURRED IN 1995-96, AND THE SVE SYSTEM WAS INSTALLED AND BROUGHT ON-LINE AFTER THAT. RD/RA OCCURRED IN TWO PHASES.THE SITE IS NOW IN OPERATION AND MAINTENANCE (O&M) AND HAS ITS 5-YEAR REVIEWS.SITE HISTORY:DISCOVERY AND CERCLIS LISTING 01-01-81NPL LISTING 10-04-89PRELIMINARY ASSESSMENT 04-01-81 (EPA) AND 04-09-87 (STATE)PRP REMOVAL (BARRELS, DRUMS, ETC) 04-14-88 TO 08-10-88EPA REMOVAL ASSESSMENTS 1990, 19**

SALT LAKE CITY, UT 84104
COUNTY: **SALT LAKE**
NATIONAL PRIORITY LISTING: **F - CURRENTLY ON THE FINAL NPL**
FEDERAL FACILITY CLASSIFICATION: **NO - NOT A FEDERAL FACILITY**
NON-NPL STATUS: **NOT REPORTED -**
NON-NPL STATUS DATE: **NOT REPORTED**
PHYSICAL CLASSIFICATION OF SITE / INCIDENT: **OTHER**

FEDERAL REGISTER INFORMATION

DATE	VOLUME	PAGE #	ACTION	HRS SCORE
05/05/1989	**54**	**19526**	**PROPOSED TO THE FINAL NPL**	**37.93000**
10/04/1989	**54**	**41015**	**PROMULGATED TO THE FINAL NPL**	**37.93000**

SITE DESCRIPTION

HAZARDOUS MATERIAL STORED: EMPTY BARRELS THAT AT ONE TIME CONTAINED MALATHION, SODIUM CHROMATE, TRICHLOROETHANE, VARIOUS DEGREASERS & SOLVENTS. BEGAN OPERATION ON UNKNOWN DATE AS BARREL STORAGE, RECYCLING, RECONDITIONING FACILITY.

SITE HISTORY **- NO SITE HISTORY INFORMATION AVAILABLE -**

ACTIONS

TYPE: **PA - PRELIMINARY ASSESSMENT**
START DATE: **NR**
COMPLETION DATE: **04/01/1981**
ACTION TYPE DEFINITION:
COLLECTION OF DIVERSE EXISTING INFORMATION ABOUT THE SOURCE AND NATURE OF THE SITE HAZARD. IT IS EPA POLICY TO COMPLETE THE PRELIMINARY ASSESSMENT WITHIN ONE YEAR OF SITE DISCOVERY.

TYPE: **OM - OPERATIONS AND MAINTENANCE**
START DATE: **09/30/1996**
COMPLETION DATE: **NR**
ACTION TYPE DEFINITION:
SITE REQUIREMENTS ASSOCIATED WITH A REMEDY THAT MUST BE PERFORMED AFTER THE COMPLETION OF A REMEDIAL ACTION.

TYPE: **NS - NATIONAL PRIORITIES LIST RESPONSIBLE PARTY SEARCH**
START DATE: **10/23/1989**
COMPLETION DATE: **01/03/1991**
ACTION TYPE DEFINITION:
THE NATIONAL PRIORITY LIST (NPL) POTENTIALLY RESPONSIBLE PARTY (PRP) SEARCH IS USED TO IDENTIFY PRPS AT A FINAL NPL OR PROPOSED NPL SITE. ACTIONS TYPICALLY INCLUDE TITLE SEARCH, FINANCIAL ASSESSMENTS, AND REVIEW OF APPLICABLE RECORDS. THE NPL PRP SEARCH SHOULD BEGIN UPON COMPLETION OF THE SCREENING SITE INVESTIGATION AND SHOULD BE CONDUCTED CONCURRENT WITH THE NATIONAL PRIORITIES LISTING PROCESS.

TYPE: **NP - PROPOSAL TO NATIONAL PRIORITIES LIST**
START DATE: **NR**
COMPLETION DATE: **05/05/1989**
ACTION TYPE DEFINITION:
SITE PROPOSED FOR INCLUSION ON THE NATIONAL PRIORITY LIST BASED ON THE HAZARD RANKING SYSTEM (HRS) SCORE FOR THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NR**
COMPLETION DATE: **03/14/1990**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NR**
COMPLETION DATE: **03/23/1990**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NR**
COMPLETION DATE: **07/16/1993**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NR**
COMPLETION DATE: **03/14/1990**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NR**
COMPLETION DATE: **03/23/1990**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NF - FINAL LISTING ON NATIONAL PRIORITIES LIST**
START DATE: **NR**
COMPLETION DATE: **10/04/1989**

ACTION TYPE DEFINITION:
SITE MOVED FROM PROPOSED LIST TO FINAL NATIONAL PRIORITY LIST.

TYPE: **PA - PRELIMINARY ASSESSMENT**
START DATE: **NR**
COMPLETION DATE: **04/09/1987**
ACTION TYPE DEFINITION:
COLLECTION OF DIVERSE EXISTING INFORMATION ABOUT THE SOURCE AND NATURE OF THE SITE HAZARD. IT IS EPA POLICY TO COMPLETE THE PRELIMINARY ASSESSMENT WITHIN ONE YEAR OF SITE DISCOVERY.

TYPE: **MA - STATE SUPPORT AGENCY COOPERATIVE AGREEMENT**
START DATE: **05/17/1990**
COMPLETION DATE: **09/30/1999**
ACTION TYPE DEFINITION:
FEDERAL RENUMERATION OF STATE ADMINISTRATIVE COSTS OF PARTICIPATION IN SITE-SPECIFIC REMEDIAL PLANNING OR IMPLEMENTATION ACTIVITIES.

TYPE: **SG - SPECIAL NOTICE ISSUED**
START DATE: **NR**
COMPLETION DATE: **07/16/1993**
ACTION TYPE DEFINITION:
ISSUANCE UNDER CERCLA SECTION 122 OF A SPECIAL NOTICE LETTER TO POTENTIALLY RESPONSIBLE PARTIES (PRPS). THE ISSUANCE OF A SPECIAL NOTICE LETTER BY EPA TRIGGERS A NEGOTIATION MORATORIUM. SPECIAL NOTICE LETTERS CAN BE ISSUED FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY, REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS.

TYPE: **MA - STATE SUPPORT AGENCY COOPERATIVE AGREEMENT**
START DATE: **03/10/1992**
COMPLETION DATE: **09/30/1999**
ACTION TYPE DEFINITION:
FEDERAL RENUMERATION OF STATE ADMINISTRATIVE COSTS OF PARTICIPATION IN SITE-SPECIFIC REMEDIAL PLANNING OR IMPLEMENTATION ACTIVITIES.

TYPE: **PC - PREPARATION OF COST DOCUMENT PACKAGE**
START DATE: **10/21/1999**
COMPLETION DATE: **03/27/2000**
ACTION TYPE DEFINITION:
PACKAGE PREPARED IN SUPPORT OF COST RECOVERY ACTIONS CONTAINING SITE-SPECIFIC COST DOCUMENTATION INFORMATION FOR DIRECT EXPENDITURES (I.E., AGENCY PAYROLL AND TRAVEL, CONTRACTING COSTS) AND INDIRECT COSTS. DOCUMENTATION MAY BE CONDENSED PER RULE 1006 OF THE FEDERAL RULES OF EVIDENCE.

TYPE: **TS - TREATABILITY STUDY**
START DATE: **08/14/1992**
COMPLETION DATE: **05/18/1993**
ACTION TYPE DEFINITION:
THE FIELD EFFORTS TO SUPPORT THE EVALUATION OF ALTERNATIVES TO DETERMINE THEIR APPLICABILITY FOR THE

SITE.

TYPE: **QX - PROSPECTIVE PURCHASER AGREEMENT ASSESSMENT**
START DATE: **07/06/2007**
COMPLETION DATE: **06/12/2009**
ACTION TYPE DEFINITION:
EPA REVIEWS A FORMAL REQUEST FOR A PROSPECTIVE PURCHASER AGREEMENT (PPA), RESULTING IN A DECISION TO GRANT OR DENY THE REQUEST.

TYPE: **LO - LODGED BY DOJ**
START DATE: **NR**
COMPLETION DATE: **12/02/1994**
ACTION TYPE DEFINITION:
AN ENFORCEMENT INSTRUMENT (E.G. CONSENT DECREE) IS LODGED BY DOJ WITH THE COURT.

TYPE: **RO - RECORD OF DECISION**
START DATE: **NR**
COMPLETION DATE: **07/07/1993**
ACTION TYPE DEFINITION:
THE FINAL RECORD OF DECISION (ROD) IS SIGNED BY THE APPROPRIATE AGENCY INDICATING THAT THE AGENCY HAS CHOSEN THE REMEDY FOR SITE REMEDIATION. ROD SIGNATURE IS SIGNIFIED BY THE COMPLETE DATE.

TYPE: **RS - REMOVAL ASSESSMENT**
START DATE: **08/30/1990**
COMPLETION DATE: **08/30/1990**
ACTION TYPE DEFINITION:
COLLECTING SITE CHARACTERISTICS TO DETERMINE WHETHER OR NOT A REMOVAL MUST BE PERFORMED.

TYPE: **RS - REMOVAL ASSESSMENT**
START DATE: **01/01/1991**
COMPLETION DATE: **06/17/1991**
ACTION TYPE DEFINITION:
COLLECTING SITE CHARACTERISTICS TO DETERMINE WHETHER OR NOT A REMOVAL MUST BE PERFORMED.

TYPE: **SG - SPECIAL NOTICE ISSUED**
START DATE: **NR**
COMPLETION DATE: **04/19/1990**
ACTION TYPE DEFINITION:
ISSUANCE UNDER CERCLA SECTION 122 OF A SPECIAL NOTICE LETTER TO POTENTIALLY RESPONSIBLE PARTIES (PRPS). THE ISSUANCE OF A SPECIAL NOTICE LETTER BY EPA TRIGGERS A NEGOTIATION MORATORIUM. SPECIAL NOTICE LETTERS CAN BE ISSUED FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY, REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS.

TYPE: **SG - SPECIAL NOTICE ISSUED**
START DATE: **NR**
COMPLETION DATE: **04/19/1990**

ACTION TYPE DEFINITION:
ISSUANCE UNDER CERCLA SECTION 122 OF A SPECIAL NOTICE LETTER TO POTENTIALLY RESPONSIBLE PARTIES (PRPS). THE ISSUANCE OF A SPECIAL NOTICE LETTER BY EPA TRIGGERS A NEGOTIATION MORATORIUM. SPECIAL NOTICE LETTERS CAN BE ISSUED FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY, REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS.

TYPE: **SG - SPECIAL NOTICE ISSUED**
START DATE: **NR**
COMPLETION DATE: **07/16/1993**
ACTION TYPE DEFINITION:
ISSUANCE UNDER CERCLA SECTION 122 OF A SPECIAL NOTICE LETTER TO POTENTIALLY RESPONSIBLE PARTIES (PRPS). THE ISSUANCE OF A SPECIAL NOTICE LETTER BY EPA TRIGGERS A NEGOTIATION MORATORIUM. SPECIAL NOTICE LETTERS CAN BE ISSUED FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY, REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS.

TYPE: **SI - SITE INSPECTION**
START DATE: **NR**
COMPLETION DATE: **05/10/1982**
ACTION TYPE DEFINITION:
THE PROCESS OF COLLECTING SITE DATA AND SAMPLES TO CHARACTERIZE THE SEVERITY OF THE HAZARD FOR THE HAZARD RANKING SCORE AND/OR ENFORCEMENT SUPPORT.

TYPE: **SI - SITE INSPECTION**
START DATE: **NR**
COMPLETION DATE: **03/15/1988**
ACTION TYPE DEFINITION:
THE PROCESS OF COLLECTING SITE DATA AND SAMPLES TO CHARACTERIZE THE SEVERITY OF THE HAZARD FOR THE HAZARD RANKING SCORE AND/OR ENFORCEMENT SUPPORT.

TYPE: **SI - SITE INSPECTION**
START DATE: **NR**
COMPLETION DATE: **06/01/1988**
ACTION TYPE DEFINITION:
THE PROCESS OF COLLECTING SITE DATA AND SAMPLES TO CHARACTERIZE THE SEVERITY OF THE HAZARD FOR THE HAZARD RANKING SCORE AND/OR ENFORCEMENT SUPPORT.

TYPE: **BF - POTENTIALLY RESPONSIBLE PARTY REMEDIAL ACTION**
START DATE: **07/23/1994**
COMPLETION DATE: **09/30/1996**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL ACTION (RA), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **RS - REMOVAL ASSESSMENT**
START DATE: **02/18/1993**
COMPLETION DATE: **09/02/1993**
ACTION TYPE DEFINITION:
COLLECTING SITE CHARACTERISTICS TO DETERMINE WHETHER OR NOT A REMOVAL MUST BE PERFORMED.

TYPE: **AS - AERIAL SURVEY**
START DATE: **08/05/1992**
COMPLETION DATE: **05/01/1993**
ACTION TYPE DEFINITION:
PROVIDE AERIAL PHOTOGRAPHY, MULTISPECTRAL SCANNER (MSS), FORWARD LOOKING INFRARED (FLIR), AND HISTORICAL AERIAL PHOTOGRAPHS WITH ANALYSES SUPPORT FOR REGIONAL OFFICES AND OERR REQUIREMENTS FOR PRE-REMEDIAL AND REMEDIAL ACTIONS. THE AERIAL SURVEY SUPPORT PROVIDES FOUR TYPES OF REMOTE SENSING PROJECTS: (1) EMERGENCY RESPONSE PROJECTS FOR RAPID ACQUISITION AND ASSESSMENT, (2) SINGLE DATE PROJECTS TO ACQUIRE CURRENT DATA, (3) INTENSIVE SITE ANALYSES TO ACQUIRE IMAGERY OVER A PERIOD OF TIME USINGHISTORICAL AERIAL PHOTOGRAPHS DATING BACK AS FAR AS 1920, (4) WASTE SITE INVENTORIES TO ESTABLISH BASELINE REFERENCE OVER LARGE AREAS. CERCLA HAZARDOUS WASTE SITES.

TYPE: **CD - CONSENT DECREE**
START DATE: **07/23/1994**
COMPLETION DATE: **04/26/1995**
ACTION TYPE DEFINITION:
JUDICIAL AGREEMENT BETWEEN THE FEDERAL GOVERNMENT AND THE POTENTIALLY RESPONSIBLE PARTIES (PRPS) FULLY OR PARTIALLY SETTLING A CLAIM UNDER CERCLA. THIS AGREEMENT MAY SETTLE LITIGATION OR MAY BE PRESENTED CONCURRENTLY WITH THE COMPLAINT (ACHIEVED THROUGH NEGOTIATIONS). THE AGREEMENT MAY BE FOR RESPONSE WORK, COST RECOVERY, OR BOTH.

TYPE: **AC - ADMINISTRATIVE ORDER ON CONSENT**
START DATE: **NR**
COMPLETION DATE: **07/08/1988**
ACTION TYPE DEFINITION:
A VOLUNTARY AND ENFORCEABLE AGREEMENT PURSUANT TO CERCLA, SIGNED BY EPA AND POTENTIALLY RESPONSIBLE PARTIES (PRPS), WHEREBY THE PRPS AGREE TO PERFORM AND/OR PAY FOR SOME OR ALL OF THE RESPONSE COSTS INVOLVED IN SITE CLEANUP. THE ORDER DESCRIBES THE PRP RESPONSE TO BE TAKEN AT A SITE, STIPULATED PENALTIES, INDEMNIFICATION, EFFECTIVE DATE, AND MAY BE SUBJECT TO PUBLIC COMMENT. IT CAN BE FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS), REMEDIAL DESIGN (RD), AND REMEDIAL ACTION (RA),PRE-SARA; BUT ONLY REMOVAL AND RI/FS, POST-SARA.

TYPE: **AC - ADMINISTRATIVE ORDER ON CONSENT**
START DATE: **NR**
COMPLETION DATE: **08/10/1990**
ACTION TYPE DEFINITION:
A VOLUNTARY AND ENFORCEABLE AGREEMENT PURSUANT TO CERCLA, SIGNED BY EPA AND POTENTIALLY RESPONSIBLE PARTIES (PRPS), WHEREBY THE PRPS AGREE TO PERFORM AND/OR PAY FOR SOME OR ALL OF THE RESPONSE COSTS INVOLVED IN SITE CLEANUP. THE ORDER DESCRIBES THE PRP RESPONSE TO BE TAKEN AT A SITE, STIPULATED PENALTIES, INDEMNIFICATION, EFFECTIVE DATE, AND MAY BE SUBJECT TO PUBLIC COMMENT. IT CAN BE FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS), REMEDIAL DESIGN (RD), AND REMEDIAL ACTION

(RA),PRE-SARA; BUT ONLY REMOVAL AND RI/FS, POST-SARA.

TYPE: **AC - ADMINISTRATIVE ORDER ON CONSENT**
START DATE: **NR**
COMPLETION DATE: **06/12/2009**
ACTION TYPE DEFINITION:
A VOLUNTARY AND ENFORCEABLE AGREEMENT PURSUANT TO CERCLA, SIGNED BY EPA AND POTENTIALLY RESPONSIBLE PARTIES (PRPS), WHEREBY THE PRPS AGREE TO PERFORM AND/OR PAY FOR SOME OR ALL OF THE RESPONSE COSTS INVOLVED IN SITE CLEANUP. THE ORDER DESCRIBES THE PRP RESPONSE TO BE TAKEN AT A SITE, STIPULATED PENALTIES, INDEMNIFICATION, EFFECTIVE DATE, AND MAY BE SUBJECT TO PUBLIC COMMENT. IT CAN BE FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS), REMEDIAL DESIGN (RD), AND REMEDIAL ACTION (RA),PRE-SARA; BUT ONLY REMOVAL AND RI/FS, POST-SARA.

TYPE: **AN - REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS**
START DATE: **07/16/1993**
COMPLETION DATE: **07/23/1994**
ACTION TYPE DEFINITION:
DISCUSSIONS AND INFORMATION EXCHANGE BETWEEN POTENTIALLY RESPONSIBLE PARTIES (PRPS) AND EPA (OR STATE) OVER THE LIABILITY OF THE PRP, WILLINGNESS, AND ABILITY TO CONDUCT THE REMEDIAL DESIGN AND/OR THE REMEDIAL ACTION AS IDENTIFIED IN THE RECORD OF DECISION (ROD).

TYPE: **JF - ECOLOGICAL RISK ASSESSMENT**
START DATE: **NR**
COMPLETION DATE: **05/08/1992**
ACTION TYPE DEFINITION:
ASSESSMENT OF THE BASELINE RISKS POSED BY THE SITE TO ECOLOGICAL RECEPTORS.

TYPE: **AR - ADMINISTRATIVE RECORDS**
START DATE: **01/02/1992**
COMPLETION DATE: **07/07/1993**
ACTION TYPE DEFINITION:
SARA SPECIFIES THAT ADMINISTRATIVE RECORDS BE COMPILED AT SUPERFUND SITES WHERE REMEDIAL OR REMOVAL RESPONSES ARE PLANNED, OR ARE OCCURRING, OR WHERE EPA IS ISSUING A UNILATERAL ORDER OR INITIATING LITIGATION TO TRACK ENFORCEMENT CASE BUDGET FUNDS USED FOR ANY RP LEAD ACTIVITY.

TYPE: **BB - POTENTIALLY RESPONSIBLE PARTY REMOVAL - TIME CRITICAL**
START DATE: **04/14/1988**
COMPLETION DATE: **08/10/1988**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMOVALS, INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF PRPS TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **BD - POTENTIALLY RESPONSIBLE PARTY REMEDIAL INVESTIGATION/FEASIBILITY STUDY**

START DATE: **08/10/1990**
COMPLETION DATE: **07/07/1993**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **BE - POTENTIALLY RESPONSIBLE PARTY REMEDIAL DESIGN**
START DATE: **09/30/1993**
COMPLETION DATE: **04/25/1995**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL DESIGN (RD), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **BE - POTENTIALLY RESPONSIBLE PARTY REMEDIAL DESIGN**
START DATE: **09/18/1995**
COMPLETION DATE: **04/01/1996**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL DESIGN (RD), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **BF - POTENTIALLY RESPONSIBLE PARTY REMEDIAL ACTION**
START DATE: **09/18/1995**
COMPLETION DATE: **09/30/1996**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL ACTION (RA), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **CM - PRELIMINARY CLOSE-OUT REPORT PREPARED**
START DATE: **NR**
COMPLETION DATE: **09/30/1996**
ACTION TYPE DEFINITION:
A REPORT PREPARED BY THE REMEDIAL PROGRAM MANAGER (RPM) VERIFYING THAT PHYSICAL CONSTRUCTION OF THE REMEDY IS COMPLETE, INDICATING MINOR PUNCH LIST ITEMS THAT REMAIN AND OUTLINING A SCHEDULE OF THE OUTSTANDING ACTIVITIES.

TYPE: **FN - REMEDIAL INVESTIGATION/FEASIBILITY STUDY NEGOTIATIONS**
START DATE: **04/19/1990**
COMPLETION DATE: **08/10/1990**
ACTION TYPE DEFINITION:
DISCUSSIONS BETWEEN EPA AND THE POTENTIALLY RESPONSIBLE PARTIES (PRPS) ON LIABILITY FOR AND CONDUCT OF A REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS).

TYPE: **CR - COMMUNITY INVOLVEMENT**
START DATE: **09/04/1990**
COMPLETION DATE: **07/30/1996**
ACTION TYPE DEFINITION:
THE COMMUNITY RELATIONS ACTIVITIES, I.E., PLAN, IMPLEMENTATION AND RESPONSIVENESS SUMMARY THAT MUST BE COMPLETED AT A SITE TO ADDRESS COMMUNITY CONCERNS.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NR**
COMPLETION DATE: **09/21/1989**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NR**
COMPLETION DATE: **02/27/1997**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NR**
COMPLETION DATE: **03/14/1990**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **AR - ADMINISTRATIVE RECORDS**
START DATE: **07/10/1988**
COMPLETION DATE: **07/10/1988**
ACTION TYPE DEFINITION:

SARA SPECIFIES THAT ADMINISTRATIVE RECORDS BE COMPILED AT SUPERFUND SITES WHERE REMEDIAL OR REMOVAL RESPONSES ARE PLANNED, OR ARE OCCURRING, OR WHERE EPA IS ISSUING A UNILATERAL ORDER OR INITIATING LITIGATION TO TRACK ENFORCEMENT CASE BUDGET FUNDS USED FOR ANY RP LEAD ACTIVITY.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NR**
COMPLETION DATE: **05/19/1993**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NR**
COMPLETION DATE: **06/28/1989**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **FE - FIVE-YEAR REVIEW**
START DATE: **12/01/2010**
COMPLETION DATE: **07/26/2011**
ACTION TYPE DEFINITION:
A REVIEW THAT IS CONDUCTED AT A MINIMUM OF EVERY FIVE YEARS TO DETERMINE IF THE IMPLEMENTATION AND PERFORMANCE OF A REMEDY IS PROTECTIVE OR WILL BE PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT.

TYPE: **FE - FIVE-YEAR REVIEW**
START DATE: **07/03/2006**
COMPLETION DATE: **09/27/2006**
ACTION TYPE DEFINITION:
A REVIEW THAT IS CONDUCTED AT A MINIMUM OF EVERY FIVE YEARS TO DETERMINE IF THE IMPLEMENTATION AND PERFORMANCE OF A REMEDY IS PROTECTIVE OR WILL BE PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT.

TYPE: **FE - FIVE-YEAR REVIEW**
START DATE: **06/01/2001**
COMPLETION DATE: **09/26/2001**
ACTION TYPE DEFINITION:
A REVIEW THAT IS CONDUCTED AT A MINIMUM OF EVERY FIVE YEARS TO DETERMINE IF THE IMPLEMENTATION AND PERFORMANCE OF A REMEDY IS PROTECTIVE OR WILL BE PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT.

TYPE: **ED - RISK/HEALTH ASSESSMENT**
START DATE: **NR**
COMPLETION DATE: **05/08/1992**

ACTION TYPE DEFINITION:
ASSESSMENT OF THE BASELINE RISKS POSED BY THE SITE TO HUMAN HEALTH.

TYPE: **DS - DISCOVERY**
START DATE: **NR**
COMPLETION DATE: **01/01/1981**
ACTION TYPE DEFINITION:
THE PROCESS BY WHICH A POTENTIAL HAZARDOUS WASTE SITE IS BROUGHT TO THE ATTENTION OF THE EPA. THE PROCESS CAN OCCUR THROUGH THE USE OF SEVERAL MECHANISMS SUCH AS A PHONE CALL OR REFERRAL BY ANOTHER GOVERNMENT AGENCY.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NR**
COMPLETION DATE: **03/23/1990**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

CONTAMINANTS
WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **2,4-DIMETHYLPHENOL**
CONTAMINANT GROUP NAME: **BASE NEUTRAL ACIDS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **2-METHYLPHENOL**
CONTAMINANT GROUP NAME: **BASE NEUTRAL ACIDS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **4-METHYLPHENOL**
CONTAMINANT GROUP NAME: **BASE NEUTRAL ACIDS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **PHENOL**
CONTAMINANT GROUP NAME: **BASE NEUTRAL ACIDS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**

CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **CYANIDE**
CONTAMINANT GROUP NAME: **INORGANICS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **ANTIMONY**
CONTAMINANT GROUP NAME: **METALS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **0.069 MG/L**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **LEAD, INORGANIC**
CONTAMINANT GROUP NAME: **METALS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **2-METHYLNAPHTHALENE**
CONTAMINANT GROUP NAME: **PAH**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **ACENAPHTHYLENE**
CONTAMINANT GROUP NAME: **PAH**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **ANTHRACENE**
CONTAMINANT GROUP NAME: **PAH**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **FLUORENE**
CONTAMINANT GROUP NAME: **PAH**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **NAPHTHALENE**
CONTAMINANT GROUP NAME: **PAH**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **PHENANTHRENE**
CONTAMINANT GROUP NAME: **PAH**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **1,2-DICHLOROETHANE**
CONTAMINANT GROUP NAME: **VOC**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **25 MG/L**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **BENZENE**
CONTAMINANT GROUP NAME: **VOC**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **1.4 MG/L**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **STYRENE (MONOMER)**
CONTAMINANT GROUP NAME: **VOC**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **TOLUENE**

FACILITY INFORMATION

UNIQUE ID: **UTD980667240NPL**
DERR ID: **UTD980667240**
FACILITY NAME: **UTAH POWER AND LIGHT AMERICAN BARREL CO.**
ADDRESS: **600 W SOUTH TEMPLE**
SALT LAKE CITY, UT 84101
COUNTY: **SALT LAKE**
SITE TYPE: **CERCLA**
PROJECT MANAGER: **CHAD GILGEN**
CONTACT PHONE: **8015364237**
PROJECT DESCRIPTION: **UPDATE 01-08-09:SITE IS A SMALL SLIVER OF LAND JUST SOUTH OF THE NORTH TEMPLE OVERPASS, BETWEEN 500 AND 600 WEST. RAILROAD TRACKS SLICE THROUGH THE PROPERTY.SITE WAS INITIALLY DISCOVERED BY LOCAL GRADE SCHOOL CHILDREN AS AN ATTRACTIVE NUISANCE DUE TO THE THOUSANDS OF EMPTY AND PARTIALLY EMPTY BARRELS ON THE GROUND. AMERICAN BARREL WAS THE NAME OF THE COMPANY THAT STORED, RECYCLED, AND RECONDITIONED 55-GALLON DRUMS OR BARRELS. THE 7-ACRE SITE WAS STORING THOUSANDS OF BARRELS IN VARIOUS CONDITIONS IN ROW AND ROW OF DRUMS PILED SEVERAL BARRELS HIGH. ONCE AN INVESTIGATION BEGUN, IT WAS DISCOVERED THAT THE SITE HAD ALSO ONCE BEEN THE LOCATION OF AN EARLY MANUFACTURED GAS PLANT IN THE LATE 1800S AND EARLY 1900S. DURING THE RI/FS STAGE, CONTAMINATION SUCH AS TARRY WASTES AND PAHS WERE FOUND AT DEPTH. CONTAMINANTS FROM THE PARTIALLY EMPTY/FULL BARRELS CONSISTED OF A WIDE RANGE OF HAZARDOUS CHEMICALS SUCH AS MALATHION, SODIUM CHROMATE, TRICHLOROETHANE, VARIOUS DEGREASERS, AND SOLVENTS. THESE CONTAMINANTS WERE GENERALLY CONFINED TO THE UPPER FEW INCHES OF THE SURFACE SOIL LEAD WAS ALSO FOUND IN THE SURFACE SOILS, PROBABLY RELATED TO THE NEARBY RAILROADS USING LEAD-CONTAMINATED SOILS IN THE AREA.THE BARRELS WERE REMOVED AND THE SITE NPL LISTED. UTAH POWER AND LIGHT WAS THE MAIN PRP SINCE THEIR PARENT COMPANY HAD OPERATED THE MANUFACTURED GAS PLANT. UPON COMPLETION OF THE RI/FS, IT WAS DECIDED TO EXCAVATE THE CONTAMINATED SOILS AND DISPOSE OF THEM, AND TO ADDRESS THE CONTAMINATED GROUNDWATER VIA NATURAL ATTENTION AND SOIL VAPOR EXTRACTION (SVE). EXCAVATION CLEANUP OCCURRED IN 1995-96, AND THE SVE SYSTEM WAS INSTALLED AND BROUGHT ON-LINE AFTER THAT. RD/RA OCCURRED IN TWO PHASES.THE SITE IS NOW IN OPERATION AND MAINTENANCE (O&M) AND HAS ITS 5-YEAR REVIEWS.SITE HISTORY:DISCOVERY AND CERCLIS LISTING 01-01-81NPL LISTING 10-04-89PRELIMINARY ASSESSMENT 04-01-81 (EPA) AND 04-09-87 (STATE)PRP REMOVAL (BARRELS, DRUMS, ETC) 04-14-88 TO 08-10-88EPA REMOVAL ASSESSMENTS 1990, 19**

MEDIA: SOIL, GW

CONTAMINANT: VOCS, OTHER ORGANICS, METALS

ABSTRACT:
THE 4-ACRE UTAH POWER & LIGHT/AMERICAN BARREL SITE IS AN INACTIVE COAL GASIFICATION AND CREOSOTE POLE TREATING PLANT LOCATED IN SALT LAKE CITY, UTAH. LAND USE IN THE AREA IS PREDOMINANTLY RESIDENTIAL, WITH LIGHT INDUSTRIAL. A SINGLE AQUIFER, CONSISTING OF THE SHALLOW, UNCONFINED AND THE DEEP, CONFINED ZONES, EXISTS BENEATH THE SITE. THE UNCONFINED ZONE IS NOT UTILIZED AS A DRINKING WATER SOURCE AT THE SITE; HOWEVER, THECONFINED ZONE IS UTILIZED AS A DRINKING WATER SUPPLY IN SOME AREAS OF THE VALLEY. THE SITE IS SITUATED IN THE JORDAN RIVER VALLEY, SURROUNDED BY MOUNTAINS, AND NEAR THE GREAT SALT LAKE. THE STUDY AREA FOR THIS SITE IS DIVIDED INTO GEOGRAPHIC AREAS CONSISTING OF THE AMERICAN BARREL YARD (ABY), THE DENVER AND RIO GRANDE WESTERN RAILROAD PROPERTY OR SOUTHEAST AREA (SEA), THE UNION PACIFIC RAILROAD PROPERTY OR NORTHWEST AREA (NWA), THE RESIDENTIAL AREA, AND THE INDUSTRIAL AREA OR DESERET PAINT SITE. FROM 1873 TO 1908, COAL GASIFICATION OPERATIONS OCCURRED ONSITE, WHICH INCLUDED COAL STORAGE SHEDS, A GAS-O-METER (GAS HOLDER), TAR WELLS, A COAL TAR STILL, THE GAS WORKS, AND THE PURIFYING HOUSE. THE GAS PLANT WAS LOCATED ON THE ABY, THE SEA, AND A PORTION OF THE NWA. THE GAS-O-METER WAS A BURIED TANK USED TO STORE GAS AFTER PRODUCTION AND BEFORE METERING OUT TO CUSTOMERS. IN THE EARLY 1900S, THIS STEP WAS ELIMINATED BY SWITCHING TO A SCRUBBER TECHNOLOGY. THE COAL GASIFICATION PROCEDURES PRODUCED BY-PRODUCTS HAVING COMMERCIAL VALUE, INCLUDING COKE, AMMONIA, TARS AND SLUDGE, TOLUENE, NAPHTHALENE, ANTHRACENE, AND PHENOLS. BY-PRODUCTS HAVING NO COMMERCIAL VALUE INCLUDED ASH, CLINKERS, HEAVY TARS,

SLUDGE, LIME SLUDGE, SPENT IRON OXIDES, LIQUID WASTES, AND STEAM CONDENSATES, WHICH WERE COMMONLY DISPOSED OF ONSITE IN PITS AND OFFSITE IN LANDFILLS. FROM 1909 TO 1929, THE SITE WAS UTILIZED AS A STORAGE YARD FOR EQUIPMENT, WOOD POWER POLES, AND OTHER ITEMS. FROM 1927 TO 1958, CREOSOTE POLE TREATING OPERATIONS OCCURRED, WHICH INCLUDED TWO POLE DIPPING TANKS:ONE UNDERGROUND, SEMI-OPEN TANK BUILT ON BURIED CONCRETE WALLS, AND ONE 400- GALLON CAPACITY STEAM HEATED TANK MADE OF WELDED OR RIVETED IRON WALLS THAT WAS USED IN CONJUCTION WITH A BOILER HOUSE AND HOT WELL TANK TO PRESSURE TREAT POLES IN HOT CREOSOTE BEFORE DRAINING INTO SIX INCHES OF SAND. THE SPECIFIC CHEMICAL COMPOSITION OF THE CREOSOTE USED ONSITE IS UNKNOWN.HOWEVER, TYPICAL CREOSOTE COMPOUNDS INCLUDE PAHS, PHENOLS, AND NITROGEN- SULFUR-, AND OXYGEN-HETEROCYCLIC COMPONENTS. FROM 1958 TO 1987, AMERICAN BARREL STORED UP TO 50,000 55-GALLON DRUMS AT ANY ONE TIME ON VIRTUALLY ALL PORTIONS OF THE ABY. IT IS ASSUMED THAT THE ENTIRE ABY WAS VULNERABLE TO LEAKS AND SPILLS OF THE DRUM CONTENTS. IN 1986, EPA CONDUCTED A SITE INVESTIGATION THAT REVEALED STAINED SOIL- AND PRODUCTCONTAINING DRUMS ONSITE. IN 1987, UTAH POWER & LIGHT (UP&L), THE PROPERTY OWNER, REQUIRED AMERICAN BARREL TO REMOVE ALL BARRELS AND DEBRIS FROM THE ABY AS TERMS FOR THEIR LEASE RENEWAL. DURING THE REMOVAL, BARREL CONTENTS CONTAINING PESTICIDES, SOLVENTS, RESINS, PAINTS AND PAINT REMOVERS, KEROSENE, GASOLINE, ETC. LEAKED AND SPILLED ONTO THE GROUND. IN 1987 AND 1988, EPA COLLECTED SOIL AND GROUND WATER SAMPLES WHICH INDICATED SOIL CONTAMINATION BY PAHS, PHENOLS, HEAVY METALS, PESTICIDES, NONAQUEOUS PHASE LIQUIDS (NAPLS), STYRENE, AND BTEX COMPOUNDS; AND GROUND WATER CONTAMINATION PRIMARILY CONSISTING OF LNAPLS, BTEX COMPOUNDS, AND STYRENE. EPA CONCLUDED THAT CONTAMINATION FROM HISTORICAL OPERATIONS AND CONTAMINANT SOURCES LEFT ONSITE AT THE TIME OF THE ABANDONMENT HAVE MIGRATED INTO THE SOIL AND GROUND WATER. IN 1988, EPA REQUIRED UP&L TO REPAIR PORTIONS OF THE EXISTING FENCE, INSTALL A NEW FENCE TO COMPLETELY SURROUND THE YARD, AND TO CUT DOWN TREES AND VEGETATION IN THE ABY. THIS ROD ADDRESSES A FINAL REMEDY FOR THE CONTAMINATED SOIL AND GROUND WATER IN THE ABY AND SEA. THE PRIMARY CONTAMINANTS OF CONCERN AFFECTING THE SOIL AND GROUND WATER ARE VOCS, INCLUDING BENZENE, TOLUENE, AND XYLENES; OTHER ORGANICS, INCLUDING PAHS, PCBS, PESTICIDES, AND PHENOLS; AND METALS, INCLUDING LEAD. SELECTED REMEDIAL ACTION: THE SELECTED REMEDIAL ACTION FOR THIS SITE INCLUDES EXCAVATING APPROXIMATELY 5,660 YD[3] OF PRINCIPAL THREAT SOIL IN THE TAR BERM AREA AND THE GAS-O-METER CONTENTS, TO THE EXTENT FEASIBLE AS DETERMINED BY EPA OR UNTIL THE CONCENTRATIONS OF EPA TARGET COMPOUND LIST PAHS ARE BELOW 9,000 MG/KG; CONDUCTING LEACHABILITY TESTS; SEGREGATING THE CONTAMINATED SOIL ONSITE INTO RCRA HAZARDOUS AND NON-HAZARDOUS WASTE, AND TEMPORARILY STORING THE WASTE ONSITE; EXCAVATING LOW-LEVEL THREAT SURFACE AND SUBSURFACE SOIL ON THE ABY AND SEA TO A DEPTH OF 10 FEET AND SEGREGATING THEM FROM PRINCIPAL THREAT RCRA HAZARDOUS WASTE ONSITE; RECYCLING APPROXIMATELY 13,850 YD[3] OF THE LOW-LEVEL THREAT SOIL OFFSITE INTO A COLD MIX ASPHALT PRODUCT USING SOLIDIFICATION; INCINERATING THE REMAINING RCRA HAZARDOUS SOIL OFFSITE IN A RCRA PERMITTED SUBTITLE C FACILITY; SEGREGATING APPROXIMATELY 4,620 YD[3] OF CALCAREOUS FILL MATERIAL UNCOVERED OR EXCAVATED DURING THE SOIL REMOVAL ACTION FROM OTHER CONTAMINATED SOIL, WITH DISPOSAL OF HAZARDOUS FILL MATERIAL OFFSITE IN A RCRA SUBTITLE C FACILITY AND NON-HAZARDOUS FILL OFFSITE IN A RCRA SUBTITLE D FACILITY; BACKFILLING THE EXCAVATED AREAS WITH CLEAN FILL AND REGRADING AND PLACING A SOIL COVER OVER THEM; INSTALLING AN IN-SITU SOIL VAPOR EXTRACTION (SVE) SYSTEM TO REMEDIATE APPROXIMATELY 570 YD[3] OF PRINCIPAL THREAT, LNAPL-CONTAMINATED SOIL IN THE ABY AND SEA USING GROUND WATER DEPRESSION AND VACUUM BLOWERS, WITH GAC TREATMENT OF RECOVERED VAPORS PRODUCED FROM THE SVE PRIOR TO DISCHARGING THEM TO THE ATMOSPHERE; EXTRACTING AND TREATING GROUND WATER ONSITE USING AIR STRIPPING AND/OR GAC; DISCHARGING THE TREATED GROUND WATER OFFSITE TO A POTW FOR FURTHER TREATMENT; ALLOWING THE REMAINING GROUND WATER CONTAMINANT PLUME TO NATURALLY ATTENUATE OVER 10 OR MORE YEARS; MONITORING THE GROUND WATER TO EVALUATE THE PROGRESS OF NATURAL ATTENUATION; AND IMPLEMENTING INSTITUTIONAL CONTROLS, INCLUDING DEED AND GROUND WATER USE RESTRICTIONS. THE ESTIMATED PRESENT WORTH COST FOR THIS REMEDIAL ACTION IS $10,583,000, WHICH INCLUDES AN ESTIMATED TOTAL O&M COST OF $2,836,000 FOR 30 YEARS. PERFORMANCE STANDARDS OR GOALS: CHEMICAL-SPECIFIC SOIL CLEANUP GOALS ARE

BASED ON HEALTH -BASED EXPOSURE LIMITS (ELS) AND FEDERAL AND STATE ARARS, AND INCLUDE BENZO(A)ANTHRACENE 47.7 MG/KG; BENZO(B)FLUORANTHENE 0.48 MG/KG; BENZO(K)FLUORANTHENE 47.7 MG/KG; BENZO(A)PYRENE 0.48 MG/KG; CHRYSENE 47.7MG/KG; DIBENZO(A,H)ANTHRACENE 0.48 MG/KG; DIELDRIN 0.36 MG/KG; INDENO(1,2,3- CD)PYRENE 47.7 MG/KG; AND LEAD 500 MG/KG. CHEMICALSPECIFIC GROUND WATER CLEANUP GOALS ARE BASED ON SDWA MCLS, THE NATIONALPRIMARY DRINKING WATER REGULATION ACTION LEVEL FOR LEAD, AND HEALTH-BASED ELS, AND INCLUDE ACENAPHTYLENE 2,190 UG/L; ANTIMONY 5 UG/L; BENZENE 5 UG/L; CYANIDE 200 UG/L;1,2-DCA 5 UG/L; 2,4-DIMETHYLPHENOL 730 UG/L; LEAD 15 UG/L; 2- METHYLNAPHTHALENE 1,460 UG/L; 2-METHYLPHENOL 1,830 UG/L; 4METHYLPHENOL 1,830 UG/L; NAPHTHALENE 1,460 UG/L; PHENOL 21,900 UG/L; STYRENE 100 UG/L; TOLUENE 1,000 UG/L; AND XYLENES 10,000 UG/L. INSTITUTIONAL CONTROLS: DEED AND GROUND WATER USE RESTRICTIONS WILL BE IMPLEMENTED TO DISCLOSE THE PRESENCE OF CONTAMINATED SOIL AND GROUND WATER ONSITE, FURTHER PROHIBIT THE DRILLING OF ANY WATER WELLS, AND PREVENT EXPOSURE TO THE GROUND WATER UNTIL REMEDIATION LEVELS ARE ACHIEVED.

REMEDY:
THE OBJECTIVE OF THIS RECORD OF DECISION (ROD) IS TO PROVIDE A REMEDY TO ADDRESS ALL CONTAMINATION CAUSED BY PREVIOUS SITE ACTIVITIES LOCATED ON THE AMERICAN BARREL YARD AND ADJACENT PROPERTIES WHICH AFFECT SURFACE SOILS, SUBSURFACE SOILS, AND GROUNDWATER. CONTAMINATION FROM HISTORICAL OPERATIONS AND CONTAMINANT SOURCES LEFT ON-SITE AT THE TIME OF ABANDONMENT HAVE MIGRATED INTO SOIL AND GROUNDWATER. REMEDIATION WILL BE TO THE EXTENT OF CONTAMINATION EMANATING FROM THE AMERICAN BARREL YARD AND DENVER RIO GRANDE AND WESTERN PROPERTIES.

THE RESPONSE ACTIONS DESCRIBED IN THIS ROD WILL PERMANENTLY ADDRESS ALL PRINCIPAL THREATS THROUGH TREATMENT. SOIL CONTAMINATION WILL BE REDUCED TO HEALTH BASED LEVELS FOR ALL CONTAMINANTS OF CONCERN. THESE LEVELS ARE BASED ON A FUTURE INDUSTRIAL USE OF THE SITE BUT WILL PROVIDE FOR FUTURE RESIDENTIAL DEVELOPMENT WITH ACCEPTABLE RISKS WITHIN EPA'S RISK RANGE OF 10[-4] TO 10[-6]. GROUNDWATER REMEDIATION LEVELS ARE BASED ON THE SAFE DRINKING WATER ACT MAXIMUM CONTAMINANT LEVELS OR ACCEPTABLE RISK LEVELS FOR FUTURE RESIDENTIAL EXPOSURE.

THE MAJOR COMPONENTS OF THE SELECTED REMEDY INCLUDE:
* EXCAVATION OF SOILS WHICH ARE PRINCIPAL THREATS BASED ON VISUAL OBSERVATION, TO THE EXTENT POSSIBLE GIVEN PHYSICAL LIMITATIONS RESULTING FROM LOCATIONS OF EXISTING RAILROAD LINES, OR UNTIL THE CONCENTRATIONS OF EPA TARGET COMPOUND LIST PAHS ARE BELOW 9,000 MG/KG. THE QUANTIFICATION OF PRINCIPAL THREATS IS BASED ON EPA GUIDANCE, "A GUIDE TO PRINCIPAL THREAT AND LOW LEVEL THREAT WASTES" WHICH SUGGESTS DEFINING PRINCIPAL THREATS AS HAVING A RISK OF 10[-3] OR GREATER.
* EXCAVATION OF SOILS EXCEEDING HEALTH BASED REMEDIATION LEVELS, BASED ON A 10[-6] WORKER EXPOSURE, THAT HAVE A POTENTIAL EXPOSURE PATHWAY. SOILS DOWN TO A DEPTH OF 10 FEET ARE CONSIDERED TO HAVE AN EXPOSURE PATHWAY.
* TREATMENT OF EXCAVATED SOILS THROUGH OFFSITE RECYCLING OF SOILS INTO A COLD MIX ASPHALT PRODUCT SUITABLE FOR PAVING ROADS. INCORPORATION OF CONTAMINATED SOILS AS A RAW MATERIAL INTO THE ASPHALT PRODUCT INVOLVES
TREATMENT THROUGH SOLIDIFICATION.
* IF ANY RCRA CHARACTERISTIC HAZARDOUS WASTES ARE ENCOUNTERED, THESE CONTAMINATED SOILS WILL BE SHIPPED OFFSITE FOR INCINERATION AND WILL NOT BE UTILIZED IN THE ASPHALT TREATMENT PROCESS.
* SOIL VAPOR EXTRACTION (SVE) WILL BE USED TO REMEDIATE PRINCIPAL THREAT LIGHT NON-AQUEOUS PHASE LIQUID (LNAPL) CONTAMINATION. LOCATION OF THE SVE EXTRACTION WELLS WILL BE BASED ON A PRINCIPAL THREAT DEFINITION WHERE BENZENE IN SOILS EXCEEDS 10[-3] RISK LEVELS FOR RESIDENTIAL EXPOSURE TO GROUNDWATER. IN CONJUNCTION WITH SVE, GROUNDWATER WILL BE EXTRACTED FROM VAPOR EXTRACTION WELLS TO ENHANCE THE SVE

PROCESS. OFF-GAS FROM THE SVE SYSTEM WILL BE TREATED PRIOR TO DISCHARGE TO THE ATMOSPHERE.
*** GROUNDWATER EXTRACTED FROM SVE WELLS, WATER PUMPED FROM EXCAVATIONS, AND DECONTAMINATION WATER WILL BE TREATED TO POTW DISCHARGE STANDARDS AND THEN DISCHARGED TO THE SALT LAKE CITY POTW FOR FURTHER TREATMENT.**
*** THE DISSOLVED PHASE AQUEOUS GROUNDWATER CONTAMINATION PLUME IS EXPECTED TO NATURALLY ATTENUATE ONCE THE PRINCIPAL THREAT SOURCES FOR GROUNDWATER CONTAMINATION ARE REMEDIATED. IF MONITORING OF GROUNDWATER CONTAMINATION INDICATES THAT NATURAL ATTENUATION IS NOT RESTORING GROUNDWATER TO REMEDIATION LEVELS, ADDITIONAL OURCE REMOVAL OR MORE ACTIVE GROUNDWATER REMEDIATION MAY BE REQUIRED.**

Back to Report Summary

MAP ID# 29

Distance from Property: 0.467 mi. (2,466 ft.) E
Elevation: 4,243 ft. (Higher than TP)

FACILITY INFORMATION

EPA ID#: **UTD980667240**
SITE ID#: **0800680**
NAME: **UTAH POWER & LIGHT/AMERICAN BARREL CO.**
ADDRESS: **600 W SOUTH TEMPLE**
SALT LAKE CITY, UT 84104
COUNTY: **SALT LAKE**
FEDERAL FACILITY: **NO - NOT A FEDERAL FACILITY**
NPL: **CURRENTLY ON THE FINAL NPL**
NON NPL STATUS: **NOT REPORTED**

Below information was gathered from the prior CERCLIS update completed in 10/2013 update:
NON-NPL STATUS DATE: **NOT REPORTED**
PHYSICAL CLASSIFICATION OF SITE / INCIDENT: **OTHER**

FEDERAL REGISTER INFORMATION

DATE	VOLUME	PAGE #	ACTION	HRS SCORE
05/05/1989	**54**	**19526**	**PROPOSED TO THE FINAL NPL**	**37.93000**
10/04/1989	**54**	**41015**	**PROMULGATED TO THE FINAL NPL**	**37.93000**

SITE DESCRIPTION

HAZARDOUS MATERIAL STORED: EMPTY BARRELS THAT AT ONE TIME CONTAINED MALATHION, SODIUM CHROMATE, TRICHLOROETHANE, VARIOUS DEGREASERS & SOLVENTS. BEGAN OPERATION ON UNKNOWN DATE AS BARREL STORAGE, RECYCLING, RECONDITIONING FACILITY.

SITE HISTORY **- NO SITE HISTORY INFORMATION AVAILABLE -**

ACTIONS

TYPE: **PA - PRELIMINARY ASSESSMENT**
START DATE: **NOT REPORTED**
COMPLETION DATE: **04/01/1981**
ACTION TYPE DEFINITION:
COLLECTION OF DIVERSE EXISTING INFORMATION ABOUT THE SOURCE AND NATURE OF THE SITE HAZARD. IT IS EPA POLICY TO COMPLETE THE PRELIMINARY ASSESSMENT WITHIN ONE YEAR OF SITE DISCOVERY.

TYPE: **OM - OPERATIONS AND MAINTENANCE**
START DATE: **09/30/1996**
COMPLETION DATE: **NOT REPORTED**
ACTION TYPE DEFINITION:
SITE REQUIREMENTS ASSOCIATED WITH A REMEDY THAT MUST BE PERFORMED AFTER THE COMPLETION OF A REMEDIAL ACTION.

TYPE: **NS - NATIONAL PRIORITIES LIST RESPONSIBLE PARTY SEARCH**
START DATE: **10/23/1989**
COMPLETION DATE: **01/03/1991**
ACTION TYPE DEFINITION:
THE NATIONAL PRIORITY LIST (NPL) POTENTIALLY RESPONSIBLE PARTY (PRP) SEARCH IS USED TO IDENTIFY PRPS AT A FINAL NPL OR PROPOSED NPL SITE. ACTIONS TYPICALLY INCLUDE TITLE SEARCH, FINANCIAL ASSESSMENTS, AND

REVIEW OF APPLICABLE RECORDS. THE NPL PRP SEARCH SHOULD BEGIN UPON COMPLETION OF THE SCREENING SITE INVESTIGATION AND SHOULD BE CONDUCTED CONCURRENT WITH THE NATIONAL PRIORITIES LISTING PROCESS.

TYPE: **NP - PROPOSAL TO NATIONAL PRIORITIES LIST**
START DATE: **NOT REPORTED**
COMPLETION DATE: **05/05/1989**
ACTION TYPE DEFINITION:
SITE PROPOSED FOR INCLUSION ON THE NATIONAL PRIORITY LIST BASED ON THE HAZARD RANKING SYSTEM (HRS) SCORE FOR THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NOT REPORTED**
COMPLETION DATE: **03/14/1990**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NOT REPORTED**
COMPLETION DATE: **03/23/1990**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NOT REPORTED**
COMPLETION DATE: **07/16/1993**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NOT REPORTED**
COMPLETION DATE: **03/14/1990**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NJ - NOTICE LETTERS ISSUED**
START DATE: **NOT REPORTED**
COMPLETION DATE: **03/23/1990**
ACTION TYPE DEFINITION:
EPA ISSUES NOTICE LETTERS TO POTENTIALLY RESPONSIBLE PARTIES INFORMING THEM OF THEIR POTENTIAL LIABILITY UNDER CERCLA AND INVITING THEM TO DISCUSS INVOLVEMENT AT THE SITE.

TYPE: **NF - FINAL LISTING ON NATIONAL PRIORITIES LIST**

START DATE: **NOT REPORTED**
COMPLETION DATE: **10/04/1989**
ACTION TYPE DEFINITION:
SITE MOVED FROM PROPOSED LIST TO FINAL NATIONAL PRIORITY LIST.

TYPE: **PA - PRELIMINARY ASSESSMENT**
START DATE: **NOT REPORTED**
COMPLETION DATE: **04/09/1987**
ACTION TYPE DEFINITION:
COLLECTION OF DIVERSE EXISTING INFORMATION ABOUT THE SOURCE AND NATURE OF THE SITE HAZARD. IT IS EPA POLICY TO COMPLETE THE PRELIMINARY ASSESSMENT WITHIN ONE YEAR OF SITE DISCOVERY.

TYPE: **MA - STATE SUPPORT AGENCY COOPERATIVE AGREEMENT**
START DATE: **05/17/1990**
COMPLETION DATE: **09/30/1999**
ACTION TYPE DEFINITION:
FEDERAL RENUMERATION OF STATE ADMINISTRATIVE COSTS OF PARTICIPATION IN SITE-SPECIFIC REMEDIAL PLANNING OR IMPLEMENTATION ACTIVITIES.

TYPE: **SG - SPECIAL NOTICE ISSUED**
START DATE: **NOT REPORTED**
COMPLETION DATE: **07/16/1993**
ACTION TYPE DEFINITION:
ISSUANCE UNDER CERCLA SECTION 122 OF A SPECIAL NOTICE LETTER TO POTENTIALLY RESPONSIBLE PARTIES (PRPS). THE ISSUANCE OF A SPECIAL NOTICE LETTER BY EPA TRIGGERS A NEGOTIATION MORATORIUM. SPECIAL NOTICE LETTERS CAN BE ISSUED FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY, REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS.

TYPE: **MA - STATE SUPPORT AGENCY COOPERATIVE AGREEMENT**
START DATE: **03/10/1992**
COMPLETION DATE: **09/30/1999**
ACTION TYPE DEFINITION:
FEDERAL RENUMERATION OF STATE ADMINISTRATIVE COSTS OF PARTICIPATION IN SITE-SPECIFIC REMEDIAL PLANNING OR IMPLEMENTATION ACTIVITIES.

TYPE: **PC - PREPARATION OF COST DOCUMENT PACKAGE**
START DATE: **10/21/1999**
COMPLETION DATE: **03/27/2000**
ACTION TYPE DEFINITION:
PACKAGE PREPARED IN SUPPORT OF COST RECOVERY ACTIONS CONTAINING SITE-SPECIFIC COST DOCUMENTATION INFORMATION FOR DIRECT EXPENDITURES (I.E., AGENCY PAYROLL AND TRAVEL, CONTRACTING COSTS) AND INDIRECT COSTS. DOCUMENTATION MAY BE CONDENSED PER RULE 1006 OF THE FEDERAL RULES OF EVIDENCE.

TYPE: **TS - TREATABILITY STUDY**
START DATE: **08/14/1992**
COMPLETION DATE: **05/18/1993**

ACTION TYPE DEFINITION:
THE FIELD EFFORTS TO SUPPORT THE EVALUATION OF ALTERNATIVES TO DETERMINE THEIR APPLICABILITY FOR THE SITE.

TYPE: **QX - PROSPECTIVE PURCHASER AGREEMENT ASSESSMENT**
START DATE: **07/06/2007**
COMPLETION DATE: **06/12/2009**
ACTION TYPE DEFINITION:
EPA REVIEWS A FORMAL REQUEST FOR A PROSPECTIVE PURCHASER AGREEMENT (PPA), RESULTING IN A DECISION TO GRANT OR DENY THE REQUEST.

TYPE: **LO - LODGED BY DOJ**
START DATE: **NOT REPORTED**
COMPLETION DATE: **12/02/1994**
ACTION TYPE DEFINITION:
AN ENFORCEMENT INSTRUMENT (E.G. CONSENT DECREE) IS LODGED BY DOJ WITH THE COURT.

TYPE: **RO - RECORD OF DECISION**
START DATE: **NOT REPORTED**
COMPLETION DATE: **07/07/1993**
ACTION TYPE DEFINITION:
THE FINAL RECORD OF DECISION (ROD) IS SIGNED BY THE APPROPRIATE AGENCY INDICATING THAT THE AGENCY HAS CHOSEN THE REMEDY FOR SITE REMEDIATION. ROD SIGNATURE IS SIGNIFIED BY THE COMPLETE DATE.

TYPE: **RS - REMOVAL ASSESSMENT**
START DATE: **08/30/1990**
COMPLETION DATE: **08/30/1990**
ACTION TYPE DEFINITION:
COLLECTING SITE CHARACTERISTICS TO DETERMINE WHETHER OR NOT A REMOVAL MUST BE PERFORMED.

TYPE: **RS - REMOVAL ASSESSMENT**
START DATE: **01/01/1991**
COMPLETION DATE: **06/17/1991**
ACTION TYPE DEFINITION:
COLLECTING SITE CHARACTERISTICS TO DETERMINE WHETHER OR NOT A REMOVAL MUST BE PERFORMED.

TYPE: **SG - SPECIAL NOTICE ISSUED**
START DATE: **NOT REPORTED**
COMPLETION DATE: **04/19/1990**
ACTION TYPE DEFINITION:
ISSUANCE UNDER CERCLA SECTION 122 OF A SPECIAL NOTICE LETTER TO POTENTIALLY RESPONSIBLE PARTIES (PRPS). THE ISSUANCE OF A SPECIAL NOTICE LETTER BY EPA TRIGGERS A NEGOTIATION MORATORIUM. SPECIAL NOTICE LETTERS CAN BE ISSUED FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY, REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS.

TYPE: **SG - SPECIAL NOTICE ISSUED**

START DATE: **NOT REPORTED**
COMPLETION DATE: **04/19/1990**
ACTION TYPE DEFINITION:
ISSUANCE UNDER CERCLA SECTION 122 OF A SPECIAL NOTICE LETTER TO POTENTIALLY RESPONSIBLE PARTIES (PRPS). THE ISSUANCE OF A SPECIAL NOTICE LETTER BY EPA TRIGGERS A NEGOTIATION MORATORIUM. SPECIAL NOTICE LETTERS CAN BE ISSUED FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY, REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS.

TYPE: **SG - SPECIAL NOTICE ISSUED**
START DATE: **NOT REPORTED**
COMPLETION DATE: **07/16/1993**
ACTION TYPE DEFINITION:
ISSUANCE UNDER CERCLA SECTION 122 OF A SPECIAL NOTICE LETTER TO POTENTIALLY RESPONSIBLE PARTIES (PRPS). THE ISSUANCE OF A SPECIAL NOTICE LETTER BY EPA TRIGGERS A NEGOTIATION MORATORIUM. SPECIAL NOTICE LETTERS CAN BE ISSUED FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY, REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS.

TYPE: **SI - SITE INSPECTION**
START DATE: **NOT REPORTED**
COMPLETION DATE: **05/10/1982**
ACTION TYPE DEFINITION:
THE PROCESS OF COLLECTING SITE DATA AND SAMPLES TO CHARACTERIZE THE SEVERITY OF THE HAZARD FOR THE HAZARD RANKING SCORE AND/OR ENFORCEMENT SUPPORT.

TYPE: **SI - SITE INSPECTION**
START DATE: **NOT REPORTED**
COMPLETION DATE: **03/15/1988**
ACTION TYPE DEFINITION:
THE PROCESS OF COLLECTING SITE DATA AND SAMPLES TO CHARACTERIZE THE SEVERITY OF THE HAZARD FOR THE HAZARD RANKING SCORE AND/OR ENFORCEMENT SUPPORT.

TYPE: **SI - SITE INSPECTION**
START DATE: **NOT REPORTED**
COMPLETION DATE: **06/01/1988**
ACTION TYPE DEFINITION:
THE PROCESS OF COLLECTING SITE DATA AND SAMPLES TO CHARACTERIZE THE SEVERITY OF THE HAZARD FOR THE HAZARD RANKING SCORE AND/OR ENFORCEMENT SUPPORT.

TYPE: **BF - POTENTIALLY RESPONSIBLE PARTY REMEDIAL ACTION**
START DATE: **07/23/1994**
COMPLETION DATE: **09/30/1996**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL ACTION (RA), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL

DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **RS - REMOVAL ASSESSMENT**
START DATE: **02/18/1993**
COMPLETION DATE: **09/02/1993**
ACTION TYPE DEFINITION:
COLLECTING SITE CHARACTERISTICS TO DETERMINE WHETHER OR NOT A REMOVAL MUST BE PERFORMED.

TYPE: **AS - AERIAL SURVEY**
START DATE: **08/05/1992**
COMPLETION DATE: **05/01/1993**
ACTION TYPE DEFINITION:
PROVIDE AERIAL PHOTOGRAPHY, MULTISPECTRAL SCANNER (MSS), FORWARD LOOKING INFRARED (FLIR), AND HISTORICAL AERIAL PHOTOGRAPHS WITH ANALYSES SUPPORT FOR REGIONAL OFFICES AND OERR REQUIREMENTS FOR PRE-REMEDIAL AND REMEDIAL ACTIONS. THE AERIAL SURVEY SUPPORT PROVIDES FOUR TYPES OF REMOTE SENSING PROJECTS: (1) EMERGENCY RESPONSE PROJECTS FOR RAPID ACQUISITION AND ASSESSMENT, (2) SINGLE DATE PROJECTS TO ACQUIRE CURRENT DATA, (3) INTENSIVE SITE ANALYSES TO ACQUIRE IMAGERY OVER A PERIOD OF TIME USINGHISTORICAL AERIAL PHOTOGRAPHS DATING BACK AS FAR AS 1920, (4) WASTE SITE INVENTORIES TO ESTABLISH BASELINE REFERENCE OVER LARGE AREAS. CERCLA HAZARDOUS WASTE SITES.

TYPE: **CD - CONSENT DECREE**
START DATE: **07/23/1994**
COMPLETION DATE: **04/26/1995**
ACTION TYPE DEFINITION:
JUDICIAL AGREEMENT BETWEEN THE FEDERAL GOVERNMENT AND THE POTENTIALLY RESPONSIBLE PARTIES (PRPS) FULLY OR PARTIALLY SETTLING A CLAIM UNDER CERCLA. THIS AGREEMENT MAY SETTLE LITIGATION OR MAY BE PRESENTED CONCURRENTLY WITH THE COMPLAINT (ACHIEVED THROUGH NEGOTIATIONS). THE AGREEMENT MAY BE FOR RESPONSE WORK, COST RECOVERY, OR BOTH.

TYPE: **AC - ADMINISTRATIVE ORDER ON CONSENT**
START DATE: **NOT REPORTED**
COMPLETION DATE: **07/08/1988**
ACTION TYPE DEFINITION:
A VOLUNTARY AND ENFORCEABLE AGREEMENT PURSUANT TO CERCLA, SIGNED BY EPA AND POTENTIALLY RESPONSIBLE PARTIES (PRPS), WHEREBY THE PRPS AGREE TO PERFORM AND/OR PAY FOR SOME OR ALL OF THE RESPONSE COSTS INVOLVED IN SITE CLEANUP. THE ORDER DESCRIBES THE PRP RESPONSE TO BE TAKEN AT A SITE, STIPULATED PENALTIES, INDEMNIFICATION, EFFECTIVE DATE, AND MAY BE SUBJECT TO PUBLIC COMMENT. IT CAN BE FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS), REMEDIAL DESIGN (RD), AND REMEDIAL ACTION (RA),PRE-SARA; BUT ONLY REMOVAL AND RI/FS, POST-SARA.

TYPE: **AC - ADMINISTRATIVE ORDER ON CONSENT**
START DATE: **NOT REPORTED**
COMPLETION DATE: **08/10/1990**
ACTION TYPE DEFINITION:
A VOLUNTARY AND ENFORCEABLE AGREEMENT PURSUANT TO CERCLA, SIGNED BY EPA AND POTENTIALLY RESPONSIBLE PARTIES (PRPS), WHEREBY THE PRPS AGREE TO PERFORM AND/OR PAY FOR SOME OR ALL OF THE

RESPONSE COSTS INVOLVED IN SITE CLEANUP. THE ORDER DESCRIBES THE PRP RESPONSE TO BE TAKEN AT A SITE, STIPULATED PENALTIES, INDEMNIFICATION, EFFECTIVE DATE, AND MAY BE SUBJECT TO PUBLIC COMMENT. IT CAN BE FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS), REMEDIAL DESIGN (RD), AND REMEDIAL ACTION (RA),PRE-SARA; BUT ONLY REMOVAL AND RI/FS, POST-SARA.

TYPE: **AC - ADMINISTRATIVE ORDER ON CONSENT**
START DATE: **NOT REPORTED**
COMPLETION DATE: **06/12/2009**
ACTION TYPE DEFINITION:
A VOLUNTARY AND ENFORCEABLE AGREEMENT PURSUANT TO CERCLA, SIGNED BY EPA AND POTENTIALLY RESPONSIBLE PARTIES (PRPS), WHEREBY THE PRPS AGREE TO PERFORM AND/OR PAY FOR SOME OR ALL OF THE RESPONSE COSTS INVOLVED IN SITE CLEANUP. THE ORDER DESCRIBES THE PRP RESPONSE TO BE TAKEN AT A SITE, STIPULATED PENALTIES, INDEMNIFICATION, EFFECTIVE DATE, AND MAY BE SUBJECT TO PUBLIC COMMENT. IT CAN BE FOR REMOVAL, REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS), REMEDIAL DESIGN (RD), AND REMEDIAL ACTION (RA),PRE-SARA; BUT ONLY REMOVAL AND RI/FS, POST-SARA.

TYPE: **AN - REMEDIAL DESIGN/REMEDIAL ACTION NEGOTIATIONS**
START DATE: **07/16/1993**
COMPLETION DATE: **07/23/1994**
ACTION TYPE DEFINITION:
DISCUSSIONS AND INFORMATION EXCHANGE BETWEEN POTENTIALLY RESPONSIBLE PARTIES (PRPS) AND EPA (OR STATE) OVER THE LIABILITY OF THE PRP, WILLINGNESS, AND ABILITY TO CONDUCT THE REMEDIAL DESIGN AND/OR THE REMEDIAL ACTION AS IDENTIFIED IN THE RECORD OF DECISION (ROD).

TYPE: **JF - ECOLOGICAL RISK ASSESSMENT**
START DATE: **NOT REPORTED**
COMPLETION DATE: **05/08/1992**
ACTION TYPE DEFINITION:
ASSESSMENT OF THE BASELINE RISKS POSED BY THE SITE TO ECOLOGICAL RECEPTORS.

TYPE: **AR - ADMINISTRATIVE RECORDS**
START DATE: **01/02/1992**
COMPLETION DATE: **07/07/1993**
ACTION TYPE DEFINITION:
SARA SPECIFIES THAT ADMINISTRATIVE RECORDS BE COMPILED AT SUPERFUND SITES WHERE REMEDIAL OR REMOVAL RESPONSES ARE PLANNED, OR ARE OCCURRING, OR WHERE EPA IS ISSUING A UNILATERAL ORDER OR INITIATING LITIGATION TO TRACK ENFORCEMENT CASE BUDGET FUNDS USED FOR ANY RP LEAD ACTIVITY.

TYPE: **BB - POTENTIALLY RESPONSIBLE PARTY REMOVAL - TIME CRITICAL**
START DATE: **04/14/1988**
COMPLETION DATE: **08/10/1988**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMOVALS, INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF PRPS TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE

SCHEDULES.

TYPE: **BD - POTENTIALLY RESPONSIBLE PARTY REMEDIAL INVESTIGATION/FEASIBILITY STUDY**
START DATE: **08/10/1990**
COMPLETION DATE: **07/07/1993**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **BE - POTENTIALLY RESPONSIBLE PARTY REMEDIAL DESIGN**
START DATE: **09/30/1993**
COMPLETION DATE: **04/25/1995**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL DESIGN (RD), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **BE - POTENTIALLY RESPONSIBLE PARTY REMEDIAL DESIGN**
START DATE: **09/18/1995**
COMPLETION DATE: **04/01/1996**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL DESIGN (RD), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **BF - POTENTIALLY RESPONSIBLE PARTY REMEDIAL ACTION**
START DATE: **09/18/1995**
COMPLETION DATE: **09/30/1996**
ACTION TYPE DEFINITION:
PROVIDES FOR OVERSIGHT OF POTENTIALLY RESPONSIBLE PARTY (PRP) RESPONSE ACTION FOR REMEDIAL ACTION (RA), INCLUDING ALL ACTIVITIES FOR MONITORING AND SUPERVISING THE PERFORMANCE OF THE RESPONSIBLE PARTIES TO DETERMINE WHETHER SUCH PERFORMANCE IS CONSISTENT WITH THE REQUIREMENTS OF THE ADMINISTRATIVE ORDERS ON CONSENT, UNILATERAL ADMINISTRATIVE ORDERS, CONSENT DECREES, JUDICIAL DECREES, INFORMATION AGREEMENTS, AND COMPLIANCE SCHEDULES.

TYPE: **CM - PRELIMINARY CLOSE-OUT REPORT PREPARED**
START DATE: **NOT REPORTED**
COMPLETION DATE: **09/30/1996**
ACTION TYPE DEFINITION:

A REPORT PREPARED BY THE REMEDIAL PROGRAM MANAGER (RPM) VERIFYING THAT PHYSICAL CONSTRUCTION OF THE REMEDY IS COMPLETE, INDICATING MINOR PUNCH LIST ITEMS THAT REMAIN AND OUTLINING A SCHEDULE OF THE OUTSTANDING ACTIVITIES.

TYPE: **FN - REMEDIAL INVESTIGATION/FEASIBILITY STUDY NEGOTIATIONS**
START DATE: **04/19/1990**
COMPLETION DATE: **08/10/1990**
ACTION TYPE DEFINITION:
DISCUSSIONS BETWEEN EPA AND THE POTENTIALLY RESPONSIBLE PARTIES (PRPS) ON LIABILITY FOR AND CONDUCT OF A REMEDIAL INVESTIGATION/FEASIBILITY STUDY (RI/FS).

TYPE: **CR - COMMUNITY INVOLVEMENT**
START DATE: **09/04/1990**
COMPLETION DATE: **07/30/1996**
ACTION TYPE DEFINITION:
THE COMMUNITY RELATIONS ACTIVITIES, I.E., PLAN, IMPLEMENTATION AND RESPONSIVENESS SUMMARY THAT MUST BE COMPLETED AT A SITE TO ADDRESS COMMUNITY CONCERNS.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NOT REPORTED**
COMPLETION DATE: **09/21/1989**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NOT REPORTED**
COMPLETION DATE: **02/27/1997**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NOT REPORTED**
COMPLETION DATE: **03/14/1990**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **AR - ADMINISTRATIVE RECORDS**

START DATE: **07/10/1988**
COMPLETION DATE: **07/10/1988**
ACTION TYPE DEFINITION:
SARA SPECIFIES THAT ADMINISTRATIVE RECORDS BE COMPILED AT SUPERFUND SITES WHERE REMEDIAL OR REMOVAL RESPONSES ARE PLANNED, OR ARE OCCURRING, OR WHERE EPA IS ISSUING A UNILATERAL ORDER OR INITIATING LITIGATION TO TRACK ENFORCEMENT CASE BUDGET FUNDS USED FOR ANY RP LEAD ACTIVITY.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NOT REPORTED**
COMPLETION DATE: **05/19/1993**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NOT REPORTED**
COMPLETION DATE: **06/28/1989**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

TYPE: **FE - FIVE-YEAR REVIEW**
START DATE: **12/01/2010**
COMPLETION DATE: **07/26/2011**
ACTION TYPE DEFINITION:
A REVIEW THAT IS CONDUCTED AT A MINIMUM OF EVERY FIVE YEARS TO DETERMINE IF THE IMPLEMENTATION AND PERFORMANCE OF A REMEDY IS PROTECTIVE OR WILL BE PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT.

TYPE: **FE - FIVE-YEAR REVIEW**
START DATE: **07/03/2006**
COMPLETION DATE: **09/27/2006**
ACTION TYPE DEFINITION:
A REVIEW THAT IS CONDUCTED AT A MINIMUM OF EVERY FIVE YEARS TO DETERMINE IF THE IMPLEMENTATION AND PERFORMANCE OF A REMEDY IS PROTECTIVE OR WILL BE PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT.

TYPE: **FE - FIVE-YEAR REVIEW**
START DATE: **06/01/2001**
COMPLETION DATE: **09/26/2001**
ACTION TYPE DEFINITION:
A REVIEW THAT IS CONDUCTED AT A MINIMUM OF EVERY FIVE YEARS TO DETERMINE IF THE IMPLEMENTATION AND PERFORMANCE OF A REMEDY IS PROTECTIVE OR WILL BE PROTECTIVE OF HUMAN HEALTH AND THE ENVIRONMENT.

TYPE: **ED - RISK/HEALTH ASSESSMENT**
START DATE: **NOT REPORTED**
COMPLETION DATE: **05/08/1992**
ACTION TYPE DEFINITION:
ASSESSMENT OF THE BASELINE RISKS POSED BY THE SITE TO HUMAN HEALTH.

TYPE: **DS - DISCOVERY**
START DATE: **NOT REPORTED**
COMPLETION DATE: **01/01/1981**
ACTION TYPE DEFINITION:
THE PROCESS BY WHICH A POTENTIAL HAZARDOUS WASTE SITE IS BROUGHT TO THE ATTENTION OF THE EPA. THE PROCESS CAN OCCUR THROUGH THE USE OF SEVERAL MECHANISMS SUCH AS A PHONE CALL OR REFERRAL BY ANOTHER GOVERNMENT AGENCY.

TYPE: **IC - ISSUE REQUEST LETTERS (104E)**
START DATE: **NOT REPORTED**
COMPLETION DATE: **03/23/1990**
ACTION TYPE DEFINITION:
EPA ISSUES LETTERS UNDER THE AUTHORITY OF SECTION 104(E) TO GATHER INFORMATION RELATED TO (1) THE IDENTIFICATION, NATURE, AND QUANTITY OF MATERIALS; (2) THE NATURE OR EXTENT OF A RELEASE OR THREATENED RELEASE OF A HAZARDOUS SUBSTANCE, POLLUTANT, OR CONTAMINANT; OR (3) THE ABILITY OF A PERSON TO PAY FOR OR TO PERFORM A CLEANUP.

CONTAMINANTS

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **2,4-DIMETHYLPHENOL**
CONTAMINANT GROUP NAME: **BASE NEUTRAL ACIDS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **2-METHYLPHENOL**
CONTAMINANT GROUP NAME: **BASE NEUTRAL ACIDS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **4-METHYLPHENOL**
CONTAMINANT GROUP NAME: **BASE NEUTRAL ACIDS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **PHENOL**

CONTAMINANT GROUP NAME: **BASE NEUTRAL ACIDS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **CYANIDE**
CONTAMINANT GROUP NAME: **INORGANICS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **ANTIMONY**
CONTAMINANT GROUP NAME: **METALS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **0.069 MG/L**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **LEAD, INORGANIC**
CONTAMINANT GROUP NAME: **METALS**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **2-METHYLNAPHTHALENE**
CONTAMINANT GROUP NAME: **PAH**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**
CONSTITUTENT CONTAMINANT MAXIMUM CONCENTRATION VALUE: **NOT REPORTED**
CONSTITUTENT CONTAMINANT OF CONCERN FLAG: **YES**
HAZARDOUS SUBSTANCE NAME: **ACENAPHTHYLENE**
CONTAMINANT GROUP NAME: **PAH**

WASTE SOURCE MEDIA CONTAMINATED NAME: **GROUNDWATER 1**

Below information was gathered from the prior NFRAP update completed in 10/2013 update:

ACTION	START DATE	COMPLETION DATE	RESPONSIBILITY
DS - DISCOVERY	**NOT REPORTED**	**6/24/1988**	**STATE (FUND)**
PA - PRELIMINARY ASSESSMENT	**NOT REPORTED**	**4/14/1989**	**STATE (FUND)**
SI - SITE INSPECTION	**NOT REPORTED**	**9/23/1992**	**STATE (FUND)**
VS - ARCHIVE SITE	**NOT REPORTED**	**9/23/1992**	**EPA IN-HOUSE**

ACTION DESCRIPTIONS

DS - (DISCOVERY) - THE PROCESS BY WHICH A POTENTIAL HAZARDOUS WASTE SITE IS BROUGHT TO THE ATTENTION OF THE EPA. THE PROCESS CAN OCCUR THROUGH THE USE OF SEVERAL MECHANISMS SUCH AS A PHONE CALL OR REFERRAL BY ANOTHER GOVERNMENT AGENCY.

PA - (PRELIMINARY ASSESSMENT) - COLLECTION OF DIVERSE EXISTING INFORMATION ABOUT THE SOURCE AND NATURE OF THE SITE HAZARD. IT IS EPA POLICY TO COMPLETE THE PRELIMINARY ASSESSMENT WITHIN ONE YEAR OF SITE DISCOVERY.

SI - (SITE INSPECTION) - THE PROCESS OF COLLECTING SITE DATA AND SAMPLES TO CHARACTERIZE THE SEVERITY OF THE HAZARD FOR THE HAZARD RANKING SCORE AND/OR ENFORCEMENT SUPPORT.

VS - (ARCHIVE SITE) - THE DECISION IS MADE THAT NO FURTHER ACTIVITY IS PLANNED AT THE SITE.

Below information was gathered from the prior NFRAP update completed in 10/2013 update:

ACTION	START DATE	COMPLETION DATE	RESPONSIBILITY
DS - DISCOVERY	**NOT REPORTED**	**10/1/1983**	**EPA FUND**
PA - PRELIMINARY ASSESSMENT	**NOT REPORTED**	**12/1/1984**	**EPA FUND**
SI - SITE INSPECTION	**NOT REPORTED**	**10/2/1990**	**STATE (FUND)**
VS - ARCHIVE SITE	**NOT REPORTED**	**10/2/1990**	**EPA IN-HOUSE**

ACTION DESCRIPTIONS

DS - (DISCOVERY) - THE PROCESS BY WHICH A POTENTIAL HAZARDOUS WASTE SITE IS BROUGHT TO THE ATTENTION OF THE EPA. THE PROCESS CAN OCCUR THROUGH THE USE OF SEVERAL MECHANISMS SUCH AS A PHONE CALL OR REFERRAL BY ANOTHER GOVERNMENT AGENCY.

PA - (PRELIMINARY ASSESSMENT) - COLLECTION OF DIVERSE EXISTING INFORMATION ABOUT THE SOURCE AND NATURE OF THE SITE HAZARD. IT IS EPA POLICY TO COMPLETE THE PRELIMINARY ASSESSMENT WITHIN ONE YEAR OF SITE DISCOVERY.

SI - (SITE INSPECTION) - THE PROCESS OF COLLECTING SITE DATA AND SAMPLES TO CHARACTERIZE THE SEVERITY OF THE HAZARD FOR THE HAZARD RANKING SCORE AND/OR ENFORCEMENT SUPPORT.

VS - (ARCHIVE SITE) - THE DECISION IS MADE THAT NO FURTHER ACTIVITY IS PLANNED AT THE SITE.

Back to Report Summary

Unlocated Sites Summary

This list contains sites that could not be mapped due to limited or incomplete address information.

No Records Found

AIRSAFS Aerometric Information Retrieval System / Air Facility Subsystem

VERSION DATE: 10/20/14

The United States Environmental Protection Agency (EPA) modified the Aerometric Information Retrieval System (AIRS) to a database that exclusively tracks the compliance of stationary sources of air pollution with EPA regulations: the Air Facility Subsystem (AFS). Since this change in 2001, the management of the AIRS/AFS database was assigned to EPA's Office of Enforcement and Compliance Assurance.

BRS Biennial Reporting System

VERSION DATE: 12/31/11

The United States Environmental Protection Agency (EPA), in cooperation with the States, biennially collects information regarding the generation, management, and final disposition of hazardous wastes regulated under the Resource Conservation and Recovery Act of 1976 (RCRA), as amended. The Biennial Report captures detailed data on the generation of hazardous waste from large quantity generators and data on waste management practices from treatment, storage and disposal facilities. Currently, the EPA states that data collected between 1991 and 1997 was originally a part of the defunct Biennial Reporting System and is now incorporated into the RCRAInfo data system.

CDL Clandestine Drug Laboratory Locations

VERSION DATE: 07/01/16

The U.S. Department of Justice ("the Department") provides this information as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments. The Department does not establish, implement, enforce, or certify compliance with clean-up or remediation standards for contaminated sites; the public should contact a state or local health department or environmental protection agency for that information.

DOCKETS EPA Docket Data

VERSION DATE: 12/22/05

The United States Environmental Protection Agency Docket data lists Civil Case Defendants, filing dates as far back as 1971, laws broken including section, violations that occurred, pollutants involved, penalties assessed and superfund awards by facility and location. Please refer to ICIS database as source of current data.

EC Federal Engineering Institutional Control Sites

VERSION DATE: 08/03/15

This database includes site locations where Engineering and/or Institutional Controls have been identified as part

of a selected remedy for the site as defined by United States Environmental Protection Agency official remedy decision documents. A site listing does not indicate that the institutional and engineering controls are currently in place nor will be in place once the remedy is complete; it only indicates that the decision to include either of them in the remedy is documented as of the completed date of the document. Institutional controls are actions, such as legal controls, that help minimize the potential for human exposure to contamination by ensuring appropriate land or resource use. Engineering controls include caps, barriers, or other device engineering to prevent access, exposure, or continued migration of contamination.

ECHOR08 Enforcement and Compliance History Information

VERSION DATE: 08/26/17

The EPA's Enforcement and Compliance History Online (ECHO) database, provides compliance and enforcement information for facilities nationwide. This database includes facilities regulated as Clean Air Act stationary sources, Clean Water Act direct dischargers, Resource Conservation and Recovery Act hazardous waste handlers, Safe Drinking Water Act public water systems along with other data, such as Toxics Release Inventory releases.

ERNSUT Emergency Response Notification System

VERSION DATE: 10/15/17

This National Response Center database contains data on reported releases of oil, chemical, radiological, biological, and/or etiological discharges into the environment anywhere in the United States and its territories. The data comes from spill reports made to the U.S. Environmental Protection Agency, U.S. Coast Guard, the National Response Center and/or the U.S. Department of Transportation.

FRSUT Facility Registry System

VERSION DATE: 09/06/17

The United States Environmental Protection Agency's Office of Environmental Information (OEI) developed the Facility Registry System (FRS) as the centrally managed database that identifies facilities, sites or places subject to environmental regulations or of environmental interest. The Facility Registry System replaced the Facility Index System or FINDS database.

HMIRSR08 Hazardous Materials Incident Reporting System

VERSION DATE: 08/30/17

The HMIRS database contains unintentional hazardous materials release information reported to the U.S. Department of Transportation located in EPA Region 8. This region includes the following states: Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming.

ICIS Integrated Compliance Information System (formerly DOCKETS)

VERSION DATE: 09/23/17

ICIS is a case activity tracking and management system for civil, judicial, and administrative federal Environmental Protection Agency enforcement cases. ICIS contains information on federal administrative and federal judicial cases under the following environmental statutes: the Clean Air Act, the Clean Water Act, the Resource Conservation and Recovery Act, the Emergency Planning and Community Right-to-Know Act - Section 313, the Toxic Substances Control Act, the Federal Insecticide, Fungicide, and Rodenticide Act, the Comprehensive Environmental Response, Compensation, and Liability Act, the Safe Drinking Water Act, and the Marine Protection, Research, and Sanctuaries Act.

ICISNPDES Integrated Compliance Information System National Pollutant Discharge Elimination System

VERSION DATE: 07/09/17

Authorized by the Clean Water Act, the National Pollutant Discharge Elimination System (NPDES) permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States.

LUCIS Land Use Control Information System

VERSION DATE: 09/01/06

The LUCIS database is maintained by the U.S. Department of the Navy and contains information for former Base Realignment and Closure (BRAC) properties across the United States.

MLTS Material Licensing Tracking System

VERSION DATE: 06/29/17

MLTS is a list of approximately 8,100 sites which have or use radioactive materials subject to the United States Nuclear Regulatory Commission (NRC) licensing requirements.

NPDESR08 National Pollutant Discharge Elimination System

VERSION DATE: 04/01/07

Authorized by the Clean Water Act, the National Pollutant Discharge Elimination System (NPDES) permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. The NPDES database was collected from December 2002 until April 2007. Refer to the PCS and/or ICIS-NPDES database as source of current data. This database includes permitted facilities located in EPA Region 8. This region includes the following states: Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming.

PADS PCB Activity Database System

VERSION DATE: 07/18/17

PADS Identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

PCSR08 Permit Compliance System

VERSION DATE: 08/01/12

The Permit Compliance System is used in tracking enforcement status and permit compliance of facilities controlled by the National Pollutant Discharge Elimination System (NPDES) under the Clean Water Act and is maintained by the United States Environmental Protection Agency's Office of Compliance. PCS is designed to support the NPDES program at the state, regional, and national levels. This database includes permitted facilities located in EPA Region 8. This region includes the following states: Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming. PCS has been modernized, and no longer exists. National Pollutant Discharge Elimination System (ICIS-NPDES) data can now be found in Integrated Compliance Information System (ICIS).

RCRASC RCRA Sites with Controls

VERSION DATE: 03/08/16

The Resource Conservation and Recovery Act (RCRA) gives EPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances. This listing refers to facilities with institutional controls in place.

SEMSLIENS SEMS Lien on Property

VERSION DATE: 07/11/17

The U.S. Environmental Protections Agency's (EPA) Office of Solid Waste and Emergency Response, Office of Superfund Remediation and Technology Innovation (OSRTI), has implemented The Superfund Enterprise Management System (SEMS), formerly known as CERCLIS (Comprehensive Environmental Response, Compensation and Liability Information System) to track and report on clean-up and enforcement activities taking place at Superfund sites. SEMS represents a joint development and ongoing collaboration between Superfund's Remedial, Removal, Federal Facilities, Enforcement and Emergency Response programs. This is a listing of SEMS sites with a lien on the property.

SFLIENS CERCLIS Liens

VERSION DATE: 06/08/12

A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which United States Environmental Protection Agency has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties. This database contains those CERCLIS sites where the Lien on Property action is complete.

SSTS Section Seven Tracking System

VERSION DATE: 12/08/14

The United States Environmental Protection Agency tracks information on pesticide establishments through the Section Seven Tracking System (SSTS). SSTS records the registration of new establishments and records pesticide production at each establishment. The Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) requires that production of pesticides or devices be conducted in a registered pesticide-producing or device-producing establishment. ("Production" includes formulation, packaging, repackaging, and relabeling.)

TRI Toxics Release Inventory

VERSION DATE: 12/31/15

The Toxics Release Inventory, provided by the United States Environmental Protection Agency, includes data on toxic chemical releases and waste management activities from certain industries as well as federal and tribal facilities. This inventory contains information about the types and amounts of toxic chemicals that are released each year to the air, water, and land as well as information on the quantities of toxic chemicals sent to other facilities for further waste management.

TSCA Toxic Substance Control Act Inventory

VERSION DATE: 12/31/12

The Toxic Substances Control Act (TSCA) was enacted in 1976 to ensure that chemicals manufactured, imported, processed, or distributed in commerce, or used or disposed of in the United States do not pose any unreasonable risks to human health or the environment. TSCA section 8(b) provides the United States Environmental Protection Agency authority to "compile, keep current, and publish a list of each chemical substance that is manufactured or processed in the United States." This TSCA Chemical Substance Inventory contains non-confidential information on the production amount of toxic chemicals from each manufacturer and importer site.

RCRAGR08 Resource Conservation & Recovery Act - Generator

VERSION DATE: 10/17/17

The Resource Conservation and Recovery Act (RCRA) gives EPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances. This listing refers to facilities currently generating hazardous waste. EPA Region 8 includes the following states: Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming.

RCRANGR08 Resource Conservation & Recovery Act - Non-Generator

VERSION DATE: 10/17/17

The Resource Conservation and Recovery Act (RCRA) gives EPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances. This listing refers to facilities classified as non-generators. Non-Generators do not presently generate hazardous waste. EPA Region 8 includes the following states: Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming.

ALTFUELS Alternative Fueling Stations

VERSION DATE: 05/16/17

Nationwide list of alternative fueling stations made available by the US Department of Energy's Office of Energy Efficiency & Renewable Energy. Includes Biodiesel stations, Ethanol (E85) stations, Liquefied Petroleum Gas (Propane) stations, Ethanol (E85) stations, Natural Gas stations, Hydrogen stations, and Electric Vehicle Supply Equipment (EVSE).

FEMAUST FEMA Owned Storage Tanks

VERSION DATE: 12/01/16

This is a listing of FEMA owned underground and aboveground storage tank sites. For security reasons, address information is not released to the public according to the U.S. Department of Homeland Security.

HISTPST Historical Gas Stations

VERSION DATE: NR

This historic directory of service stations is provided by the Cities Service Company. The directory includes Cities Service filling stations that were located throughout the United States in 1930.

ICISCLEANERS Integrated Compliance Information System Drycleaners

VERSION DATE: 09/23/17

This is a listing of drycleaner facilities from the Integrated Compliance Information System (ICIS). The Environmental Protection Agency (EPA) tracks facilities that possess NAIC and SIC codes that classify businesses as drycleaner establishments.

MRDS Mineral Resource Data System

VERSION DATE: 03/15/16

MRDS (Mineral Resource Data System) is a collection of reports describing metallic and nonmetallic mineral resources throughout the world. Included are deposit name, location, commodity, deposit description, geologic characteristics, production, reserves, resources, and references. This database contains the records previously provided in the Mineral Resource Data System (MRDS) of USGS and the Mineral Availability System/Mineral Industry Locator System (MAS/MILS) originated in the U.S. Bureau of Mines, which is now part of USGS.

MSHA Mine Safety and Health Administration Master Index File

VERSION DATE: 09/01/17

The Mine dataset lists all Coal and Metal/Non-Metal mines under MSHA's jurisdiction since 1/1/1970. It includes such information as the current status of each mine (Active, Abandoned, NonProducing, etc.), the current owner and operating company, commodity codes and physical attributes of the mine. Mine ID is the unique key for this data. This information is provided by the United States Department of Labor - Mine Safety and Health Administration (MSHA).

BF Brownfields Management System

VERSION DATE: 08/17/17

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. The United States Environmental Protection Agency maintains this database to track activities in the various brown field grant programs including grantee assessment, site cleanup and site redevelopment. This database included tribal brownfield sites.

DNPL Delisted National Priorities List

VERSION DATE: 10/10/17

This database includes sites from the United States Environmental Protection Agency's Final National Priorities List (NPL) where remedies have proven to be satisfactory or sites where the original analyses were inaccurate, and the site is no longer appropriate for inclusion on the NPL, and final publication in the Federal Register has occurred.

NLRRCRAT No Longer Regulated RCRA Non-CORRACTS TSD Facilities

VERSION DATE: 10/17/17

This database includes RCRA Non-Corrective Action TSD facilities that are no longer regulated by the United States Environmental Protection Agency or do not meet other RCRA reporting requirements. This listing includes facilities that formerly treated, stored or disposed of hazardous waste.

ODI Open Dump Inventory

VERSION DATE: 06/01/85

The open dump inventory was published by the United States Environmental Protection Agency. An “open dump” is defined as a facility or site where solid waste is disposed of which is not a sanitary landfill which meets the criteria promulgated under section 4004 of the Solid Waste Disposal Act (42 U.S.C. 6944) and which is not a facility for disposal of hazardous waste. This inventory has not been updated since June 1985.

RCRAT Resource Conservation & Recovery Act - Non-CORRACTS Treatment, Storage & Disposal Facilities

VERSION DATE: 10/17/17

The Resource Conservation and Recovery Act (RCRA) gives EPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances. This listing refers to facilities recognized as hazardous waste treatment, storage, and disposal sites (TSD).

SEMS Superfund Enterprise Management System

VERSION DATE: 10/10/17

The U.S. Environmental Protections Agency's (EPA) Office of Solid Waste and Emergency Response, Office of Superfund Remediation and Technology Innovation (OSRTI), has implemented The Superfund Enterprise Management System (SEMS), formerly known as CERCLIS (Comprehensive Environmental Response, Compensation and Liability Information System) to track and report on clean-up and enforcement activities taking place at Superfund sites. SEMS represents a joint development and ongoing collaboration between Superfund's Remedial, Removal, Federal Facilities, Enforcement and Emergency Response programs.

SEMSARCH Superfund Enterprise Management System Archived Site Inventory

VERSION DATE: 10/10/17

The Superfund Enterprise Management System Archive listing (SEMS-ARCHIVE) has replaced the CERCLIS NFRAP reporting system in 2015. This listing reflect sites that have been assessed and no further remediation is planned and is of no further interest under the Superfund program.

SMCRA Surface Mining Control and Reclamation Act Sites

VERSION DATE: 08/25/17

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

USUMTRCA Uranium Mill Tailings Radiation Control Act Sites

VERSION DATE: 03/04/17

The Legacy Management Office of the Department of Energy (DOE) manages radioactive and chemical waste, environmental contamination, and hazardous material at over 100 sites across the U.S. The L.M. Office manages this database of sites registered under the Uranium Mill Tailings Control Act (UMTRCA).

DOD Department of Defense Sites

VERSION DATE: 06/21/10

This information originates from the National Atlas of the United States Federal Lands data, which includes lands owned or administered by the Federal government. Army DOD, Army Corps of Engineers DOD, Air Force DOD, Navy DOD and Marine DOD areas of 640 acres or more are included.

FUDS Formerly Used Defense Sites

VERSION DATE: 06/01/15

The Formerly Used Defense Sites (FUDS) inventory includes properties previously owned by or leased to the United States and under Secretary of Defense Jurisdiction, as well as Munitions Response Areas (MRAs). The remediation of these properties is the responsibility of the Department of Defense. This data is provided by the U.S. Army Corps of Engineers (USACE), the boundaries/polygon data are based on preliminary findings and not all properties currently have polygon data available. DISCLAIMER: This data represents the results of data collection/processing for a specific USACE activity and is in no way to be considered comprehensive or to be used in any legal or official capacity as presented on this site. While the USACE has made a reasonable effort to insure the accuracy of the maps and associated data, it should be explicitly noted that USACE makes no warranty, representation or guaranty, either expressed or implied, as to the content, sequence, accuracy, timeliness or completeness of any of the data provided herein. For additional information on Formerly Used Defense Sites please contact the USACE Public Affairs Office at (202) 528-4285.

FUSRAP Formerly Utilized Sites Remedial Action Program

VERSION DATE: 03/04/17

The U.S. DOE established the Formerly Utilized Sites Remedial Action Program (FUSRAP) in 1974 to remediate sites where radioactive contamination remained from the Manhattan Project and early U.S. Atomic Energy Commission (AEC) operations. The DOE Office of Legacy Management (LM) established long-term surveillance and maintenance (LTS&M) requirements for remediated FUSRAP sites. DOE evaluates the final site conditions of a remediated site on the basis of risk for different future uses. DOE then confirms that LTS&M requirements will maintain protectiveness.

NLRRCRAC No Longer Regulated RCRA Corrective Action Facilities

VERSION DATE: 10/17/17

This database includes RCRA Corrective Action facilities that are no longer regulated by the United States Environmental Protection Agency or do not meet other RCRA reporting requirements.

NMS Former Military Nike Missile Sites

VERSION DATE: 12/01/84

This information was taken from report DRXTH-AS-IA-83A016 (Historical Overview of the Nike Missile System, 12/1984) which was performed by Environmental Science and Engineering, Inc. for the U.S. Army Toxic and Hazardous Materials Agency Assessment Division. The Nike system was deployed between 1954 and the mid-1970's. Among the substances used or stored on Nike sites were liquid missile fuel (JP-4); starter fluids (UDKH, aniline, and furfuryl alcohol); oxidizer (IRFNA); hydrocarbons (motor oil, hydraulic fluid, diesel fuel, gasoline, heating oil); solvents (carbon tetrachloride, trichloroethylene, trichloroethane, stoddard solvent); and battery electrolyte. The quantities of material a disposed of and procedures for disposal are not documented in published reports. Virtually all information concerning the potential for contamination at Nike sites is confined to personnel who were assigned to Nike sites.
During deactivation most hardware was shipped to depot-level supply points. There were reportedly instances where excess materials were disposed of on or near the site itself at closure. There was reportedly no routine site decontamination.

NPL National Priorities List

VERSION DATE: 10/10/17

This database includes United States Environmental Protection Agency (EPA) National Priorities List sites that fall under the EPA's Superfund program, established to fund the cleanup of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action.

PNPL Proposed National Priorities List

VERSION DATE: 10/10/17

This database contains sites proposed to be included on the National Priorities List (NPL) in the Federal Register. The United States Environmental Protection Agency investigates these sites to determine if they may present long-term threats to public health or the environment.

RCRAC Resource Conservation & Recovery Act - Corrective Action Facilities

VERSION DATE: 10/17/17

The Resource Conservation and Recovery Act (RCRA) gives EPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances. This listing refers to facilities with corrective action activity.

RCRASUBC Resource Conservation & Recovery Act - Subject to Corrective Action Facilities

VERSION DATE: 10/17/17

The Resource Conservation and Recovery Act (RCRA) gives EPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances. This listing refers to facilities subject to corrective actions.

RODS Record of Decision System

VERSION DATE: 01/23/12

These decision documents maintained by the United States Environmental Protection Agency describe the chosen remedy for NPL (Superfund) site remediation. They also include site history, site description, site characteristics, community participation, enforcement activities, past and present activities, contaminated media, the contaminants present, and scope and role of response action.

ICEC Institutional Engineering Controls Registry

VERSION DATE: 10/15/17

The Utah Department of Environmental Quality is required to maintain a record of the properties subject to environmental covenants/institutional controls established under Utah Code, Title 19, Chapter 10. This list Leaking Underground Storage Tank sites, CERCLA/Superfund Branch Sites, and Voluntary Cleanup sites that have environmental controls established under this statute and pursuant to Utah Code Ann. §§ 57-25-101 et seq and controls established prior to the enactment of this statute. The controls have been recorded by the owner of the real property in the county recorder's office in the county where the real property is located.

SLCCDL Salt Lake County Clandestine Drug Laboratory

VERSION DATE: 10/04/17

The purpose of this regulation is to protect the public's health, safety, and welfare by establishing standards, procedures, and responsibilities for the regulation of the occupancy and use of property where hazardous or dangerous chemicals or chemical residues commonly associated with the manufacture of illegal drugs or other hazardous or dangerous chemicals are or may be present; the regulation of the decontamination of such contaminated properties; and the regulation of the disposal of hazardous or dangerous materials and contaminated debris removed from contaminated properties.

TIERII Tier II Facilities

VERSION DATE: 09/18/17

This database contains locations of Tier II facilities under the Emergency Planning and Community Right-to-Know Act (EPCRA). This data is maintained by the Utah Department of Environmental Quality's Division of Environmental Response and Remediation (DERR). The DERR assumes no responsibility or liability for the accuracy of the location of these facilities. This database also includes some Tier II facility information from the Utah Automated Geographic Reference Center (AGRC) for informational purposes. Qualifying facilities report on hazardous and toxic chemicals and are labeled either tier I or tier II. Locations are based on coordinates derived from maps and GPS data. These locations represent sites, not contaminated areas.

RUST Registered Underground Storage Tanks

VERSION DATE: 09/05/17

The Utah State Underground Storage Tank program of the Department of Environmental Quality provides this list of underground storage tank sites.

BF Brownfield Properties

VERSION DATE: 09/05/17

This database of brownfields (targeted) and other brownfield (non-targeted) properties is maintained by the Utah Department of Environmental Quality's Division of Environmental Response and Remediation (DERR).

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped open land, and both improves and protects the environment. The DERR assumes no responsibility or liability for the accuracy of the location of these properties.

CERCLIS CERCLIS Sites

VERSION DATE: 10/18/17

This database of Comprehensive Environmental Response, Compensation, and Liability System sites is maintained by the Utah Department of Environmental Quality's Division of Environmental Response and Remediation (DERR). The CERCLA Branch of the DERR performs site investigations of potentially contaminated sites within the State of Utah to determine whether or not they pose a threat to human health and the environment and should be included on the Federal Superfund National Priorities List. The DERR assumes no responsibility or liability for the accuracy of the location of these properties.

LFSWDS Landfill and Solid Waste Disposal Sites

VERSION DATE: 10/09/17

This list of permitted solid waste facilities is provided by the Utah Department of Environmental Quality.

LUST Leaking Underground Storage Tanks

VERSION DATE: 09/07/17

The Utah State Underground Storage Tank program of the Department of Environmental Quality provides this list of leaking underground storage tank sites. The primary goal of this program is to protect human health and the environment from leaking underground storage tanks. The UST staff oversees UST notification, installation, inspection, removal, and compliance with State and Federal UST regulations concerning release prevention and remediation.

VCP Voluntary Cleanup Program Sites

VERSION DATE: 10/25/17

This list of Voluntary Cleanup Program sites is maintained by the Utah Department of Environmental Quality's Division of Environmental Response and Remediation (DERR). The DERR assumes no responsibility or liability for the accuracy of the location of these facilities. In 1997, the Utah Voluntary Cleanup Program (VCP) was created to promote the voluntary cleanup of contaminated sites. The VCP is intended to encourage redevelopment of Brownfields and other impacted sites by providing a streamlined cleanup program. This database also includes some Voluntary Cleanup information from the Utah Automated Geographic Reference Center (AGRC) for informational purposes. Locations are based on coordinates derived from maps and GPS data.

NPL National Priorities List

VERSION DATE: 10/20/17

The National Priorities List (NPL) is provided by the Utah Department of Environmental Quality's Division of Environmental Response and Remediation (DERR). Before a cleanup of a hazardous waste site can take place under Superfund, it must be included on the National Priority List. The NPL is a published list of hazardous waste sites that are eligible for extensive, long-term cleanup action under the Superfund program. When no responsible party can be found, listing on the NPL allows EPA and the State to access the Superfund Trust fund to pay for site cleanup. The DERR assumes no responsibility or liability for the accuracy of the location of these properties.

Environmental Records Definitions - TRIBAL

USTR08 Underground Storage Tanks On Tribal Lands

VERSION DATE: 05/01/17

This database, provided by the United States Environmental Protection Agency (EPA), contains underground storage tanks on Tribal lands located in EPA Region 8. This region includes the following states: Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming.

LUSTR08 Leaking Underground Storage Tanks On Tribal Lands

VERSION DATE: 05/01/17

This database, provided by the United States Environmental Protection Agency (EPA), contains leaking underground storage tanks on Tribal lands located in EPA Region 8. This region includes the following states: Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming.

ODINDIAN Open Dump Inventory on Tribal Lands

VERSION DATE: 11/08/06

This Indian Health Service database contains information about facilities and sites on tribal lands where solid waste is disposed of, which are not sanitary landfills or hazardous waste disposal facilities, and which meet the criteria promulgated under section 4004 of the Solid Waste Disposal Act (42 U.S.C. 6944).

INDIANRES Indian Reservations

VERSION DATE: 01/01/00

The Department of Interior and Bureau of Indian Affairs maintains this database that includes American Indian Reservations, off-reservation trust lands, public domain allotments, Alaska Native Regional Corporations and Recognized State Reservations.

SQG/CESQG
COMPLIANCE EVALUATION INSPECTION

2014-011987

Date of Inspection:	August 27, 2014
Facility:	Schovaers Electronics Corp.
Facility Address:	22 Jeremy Street, Salt Lake City Utah 84104
County:	Salt Lake
EPA ID #	UTD085325769
Latitude / Longitude:	40.768652-111.915774
Generator Status:	SQG
Number of Employees:	5
Arrival / Departure Time:	11:30 a.m. to 12:30 p.m.
Weather Conditions:	Sunny, 70°F
Report Prepared By:	
Names of Inspectors:	Alex Pashley
Local Health Department Notification:	Salt Lake County Health Department, Notified was by e-mail on August 26, 2014.
Facility Notification / Date:	Unannounced
Applicable Rules:	**R315:** R315-5, R315-13, R315-16 and R315-9 of the Utah Administrative Code

CREDENTIALS

On August 27, 2014 the inspection team (team) met with and presented credentials to Bob Schovaers.

PURPOSE AND SCOPE

The purpose of this Compliance Evaluation Inspection (CEI) was to evaluate the Facility's waste management practices for compliance with R315 of the Utah Administrative Code (the Rules), Utah Solid and Hazardous Waste Act 19-6-101.

FACILITY DESCRIPTION AND WASTE MANAGEMENT OPERATIONS

Schovaers Electronics Corp. (Schovaers) is a circuit board plater and manufacture. Schovaers generates about 166 lbs. of waste water treatment filter press sludge cake (FOO6) per month, which is CESQG amounts. The filter press cake contains some lead (D008). Schovaers tries to completely fill a marino bag, before it is sent off for disposal, because it costs $300 dollars whether the marino bag is full or not. The problem is that a full marino bag of filter press sludge may weight more than the allowed 2,200lbs allowed under the CESQG rules, therefore Schovaers has decided to stay in the SQG category. Before placing the filter press cake into the marino bag, it is accumulated in 55-gallon drums. The drums were properly labeled and closed, however one of the drums was in very poor condition and had a corrosion hole in it (see pic). The filter press cake was dried, and was not leaking from the drum. Mr. Schovaer was told that all four drums needed to be replaced immediately. He indicated that he had four poly drums in back that he would start using.

All SQG required records and plans were in place and in good order. No problems were noted.

COMPLIANCE STATUS:

R315-5	**Hazardous Waste Generator Requirements**	
5-1.11	Determination of Whether a Waste is a Hazardous Waste	OK
5-1.12	EPA Identification Numbers UTD085325769	
5-2.20	Manifest OK	
5-3.30-3.33	Packaging, Labeling, Marking, and Placarding OK	
5.3.34	Accumulation Time OK	
	Container Management OK	
	Tank Management OK	
	Preparedness and Prevention OK	
5-4.40	Recordkeeping OK	
5-4.41	Biennial Reporting OK	

5-4.42 Exception Reporting N/A

5-4.43.1 Additional Reporting N/A

R315-13-1 Land Disposal Restrictions

13-1 Land Disposal Restrictions OK

R315-16 Standards for Universal Waste

R315-9 Spill Response

APPENDIX E
CREDENTIALS

CHRISTINA CHENEY
ESA GROUP MANAGER

PROFESSIONAL EXPERIENCE
Ms. Cheney joined Neil O. Anderson and Associates, a Terracon Company, in 2004. In 2014 she began working for Terracon's Salt Lake City office. Working under the guidance of Terracon's professional engineering staff, which includes geotechnical engineers, geologists, and geoscientists, she quickly gained extensive experience in environmental site investigations and remediations.

Her specific expertise includes environmental site assessments; surface and groundwater contamination assessments, prevention, monitoring and control; risk assessments and risk reduction recommendations; soil contamination assessments, and the prevention, monitoring and control; and other areas of expertise relating to hazardous substances and/or hazardous waste management.

Ms. Cheney has 12 years of experience performing Phase I Environmental Site Assessments (ESAs). She has conducted over 200 studies, including auto shops/gasoline stations, residential properties, dairies, industrial properties, and agricultural properties. These studies have been conducted in Utah, Idaho, Colorado, and California and have followed ASTM Standard E1527-13 and EPA's All Appropriate Inquiry Standard. Phase I ESA report completion is often needed to complete the sale of commercial property. For less suspect properties, she has performed and managed the Transaction Screen Process, ASTM Standard E1528-14, and Regulatory Database Reviews, understanding the limits of those studies recommendations were sometimes needed to transition to a Phase I ESA when Potential Environmental Conditions should be more fully researched, evaluated and discussed.

PROJECT EXPERIENCE
Cobalt Phase I ESAs - Salt Lake City, Utah
Ms. Cheney served as an assistant for several concurrent Phase I ESAs for several industrial properties in the Salt Lake Valley. Reviewed historical and county records, federal, state, and local agency databases, conducted interviews, and also coauthored the report. Recognized environmental conditions were identified and, a Phase II ESA was recommended on several sites.

Sears Phase I ESAs - California and Utah
Ms. Cheney served as Project Manager for several concurrent Phase I ESAs for several Sears' stores in both California and Utah. Reviewed historical and county records, federal, state, and local agency databases, conducted interviews, and also coauthored the reports. Recognized environmental conditions were identified and, a Phase II ESA was recommended on several sites.

Ensign Group, Senior Care Facilities - Various Locations
Ms. Cheney served as Project Manager for several concurrent Phase I ESAs for senior-care facilities in Utah. She reviewed historical and county records, federal, state, and local agency databases, conducted interviews, and the reports.

Royal Woods Plaza - Salt Lake City, Utah
Ms. Cheney served as Project Manager for this project. She reviewed historical and county records, federal, state, and local agency databases, conducted

EDUCATION
Brigham Young University, Bachelors of Science in Recreation Management & Leisure Services, 2002

Ricks College, Associates of Science in Electronics Engineering Technology, 1999

Ricks College, Associates of Science in Computer Systems Technology, 1999

CERTIFICATIONS
Registered Environmental Assessor #30103 (2008-2012)

AHERA: Building Inspector

WORK HISTORY
Terracon Consultants, Inc., ESA Group Manager, 2016-Present

Terracon Consultants, Inc., Staff Environmental Scientist, 2014-2016

Neil O. Anderson & Associates, Staff Environmental Scientist, 2004-2014

interviews, and also authored the report. She identified a former gas station at the site. Recognized environmental conditions were identified and a Phase II ESA was recommended.

Parkway Commons - Murray Utah, Utah
Ms. Cheney served as Project Manager for the Phase I ESAs and limited sampling. Sampling included radon, lead in water, and asbestos. She reviewed historical and county records, federal, state, and local agency databases, conducted interviews, and authored the report.

Wells Fargo Bank - Various Locations
Ms. Cheney served as Project Manager for several Phase I ESAs throughout Utah for Wells Fargo Bank. Visual and limited sampling for asbestos was included for some of the reports. She reviewed historical and county records, federal, state, and local agency databases, conducted interviews, and authored the reports.

The Church of Jesus Christ of Latter-day Saints - Various Locations
Ms. Cheney served as Project Manager for several Phase I ESAs throughout Utah for the Church of Jesus Christ of Latter-day Saints. She reviewed historical and county records, federal, state, and local agency databases, conducted interviews, and authored the reports.

Cosumnes River College - Sacramento, California
CEQA Initial Study – Provided environmental assessment for the construction of a new athletic field complex at Cosumnes River College Campus for the Los Rios Community College School District. Neil O. Anderson & Associates acted as the premier agent in performing Initial Study – Mitigated Negative Declarations for the site.

Elk Grove Satellite Campus - Elk Grove, California
CEQA Initial Study - Provided environmental assessment for the construction of new athletic field complex at Elk Grove Campus for the Los Rios Community College School District. Neil O. Anderson & Associates acted as the premier agent in performing both Initial Study – Mitigated Negative Declarations and Traffic Studies for the site.

Madera High School - Madera, California
Provided environmental assessment for the construction of a new high school in Madera. Neil O. Anderson & Associates acted as the premier agent in performing the Initial Study, Preliminary Environmental Assessment (PEA) Removal Action (RA) Reports for the site. Ms. Cheney reviewed the Initial Study and worked with the Project Manager on the write-up of the PEA Workplan, PEA, RA Workplan, and RA reports.

Chinchiolo Stemilt Groundwater Monitoring - Stockton, California
Ms. Cheney served as a staff scientist on this project, which involved quarterly and annual monitoring to the Central Valley Regional Water Quality Control Board. Responsibilities included creating groundwater contour maps from groundwater data collected from on-site monitoring wells, calculating the flow direction and hydraulic gradient of groundwater at the subject property, analyzing and interpreting analytical data, and compiling the quarterly and annual reports.

Grupe Real Estate Phase I ESAs - Alamo, Martinez, Lafayette, El Dorado Hills, California
Ms. Cheney served as Project Manager for four concurrent Phase I ESAs for proposed residential developments in Contra Costa County and El Dorado County. Reviewed historical and county records, federal, state, and local agency databases, conducted interviews, and also coauthored the report. Recognized environmental conditions, including possible lead-based paint, asbestos, and pesticides, were identified on one subject property; a Phase II ESA was recommended.

Benjamin B. Bowers

ENVIRONMENTAL DEPARTMENT MANAGER

EDUCATION
Bachelor of Science, Environmental Policy, St. Norbert College, 1998

CERTIFICATIONS
40-Hour OSHA Hazardous Wastes Operations Training, Utah (2000)

State of Utah UST Certified Consultant, Utah CC 195

Certified UST Groundwater and Soil Sampler, Utah GS-1419

Nuclear Density Gauge Safety Training (1998)

AFFILIATIONS
Utah Alliance For Economic Development

WORK HISTORY
Terracon Consultants, Inc. Environmental Dept. Manager, 2006 –Present; Project Manager, 2004 – 2006; Staff Scientist, 2003-2004

PSI, Inc. , Environmental Project Manager, 2002-2003

Giles Engineering Assoc., Inc., Staff Scientist, 1999-2002; CMT Field Technician, 1998-1999

PROFESSIONAL EXPERIENCE

Mr. Bowers is the Environmental Department Manager in Terracon's Salt Lake City office. He has more than 18 years of valuable and proactive experience in the environmental, construction materials and geotechnical consulting fields. His experience includes Phase I, II, and III environmental site assessments (ESAs), National Environmental Policy Act (NEPA), Brownfields, subsurface investigations, remediation, asbestos inspections, construction materials testing, and geotechnical engineering. His expertise complements projects that require multiple consulting services and enhances the sharing of information and understanding between the environmental, construction materials, and geotechnical disciplines. Mr. Bowers is responsible for the management and overview of over 100 environmental site assessments a year and has participated in more than 1,000 Phase I, Phase II, and remediation projects. Over his 18-year career, Mr. Bowers has personally completed hundreds of Phase I ESAs on a variety of sites, ranging from retail, industrial, residential, agricultural and undeveloped.

Mr. Bowers has acted as project manager for numerous site investigations and remediation projects for petroleum distributors, Brownfield projects, municipalities, and commercial and industrial property owners. He has developed remedial action plans based upon the property owners' objective and hydrogeological conditions. Remedial actions included soil excavation, mechanical soil and groundwater treatment systems, in-situ bioremediation, oxidization, and natural attenuation.

PROJECT EXPERIENCE

PHASE I ENVIRONMENTAL SITE ASSESSMENTS

Norbest Foods – Various Sites, Utah
Managed the completion of Phase I ESAs on 13 individual properties as part of a commercial refinancing portfolio for the property owner. The subject sites varied from vacant land, gasoline/service stations, food-processing facilities, and turkey farms. During the ESA process, numerous RECs were identified associated with leaking aboveground and underground storage tanks, oil spills originating from automotive maintenance on the sites and compressor blow-down. Mr. Bowers managed site soil remediation at three of the 13 sites and achieved no further action status for the releases.

FDIC – Various Sites – Utah
Served as technical reviewer for over 40 Phase I ESAs and Phase IIs. Sites included retail, office, commercial, industrial, proposed residential developments, and vacant properties.

In-N-Out Burgers – Various Sites, Utah, Nevada, California and Texas
As the National Account Manager for In-N-Out Burgers located in California, Mr. Bowers has managed the completion of over 100 Phase I ESAs, Limited Site Investigations, and geotechnical investigations in six western US states.

TELECOMMUNICATIONS

Over 900 Towers for Telecommunication Firms – Utah, Idaho and Wyoming
Managed the completion of Phase I ESAs, Section 106 and NEPA work for more than 800 cell tower sites for various cellular companies throughout the states of Utah, Idaho, and Wyoming. Clients include AT&T, Verizon Wireless, T-Mobile, Cricket, Sprint, and other telecommunication service companies, such as General Dynamics, Clearwire, Pacific Telecom Service, Overland, and Black & Veatch Company among others.

UST/LUST

Former Roadway Express Facility – Salt Lake City, Utah
Project Manager for the investigation and remediation of the site after a failing leak detection test was reported on a new oil product line that serviced three fuel islands at the trucking terminal. During the investigation, new motor oil was detected above regulatory limits in the soil and groundwater on the site. Terracon prepared an Underground Storage Tank (UST) closure plan and closure notice before abandoning the oil product lines in-place. Soil sampling indicated widespread oil and diesel contamination along the product lines and dispensers. Mr. Bowers prepared a Corrective Action Plan (CAP) to excavate the petroleum-impacted soils. Approximately 720 tons of impacted soils were removed and disposed at a licensed facility. Terracon implemented a quarterly groundwater sampling program and was able to remediate soil and groundwater below regulatory limits and received no further action for the site release.

At the same site, Mr. Bowers managed a Limited Site Investigation in the area of the on-site maintenance building and diesel tank farm that serviced the site and identified oil and diesel constituents above regulatory limits in the soil and groundwater. Terracon developed and completed a pilot test to determine the feasibility of full-scale anaerobic bioremediation using an oil digestant, BioRem 2000®. The pilot test included physical contaminant removal using vacuum-enhanced fluid recovery (VEFR) to remove vapor and dissolved and free-phase volatile organic compounds (VOCs) from the subsurface. Approximately 16,000-gallons of petroleum-impacted water was removed, treated on site with an air sparging system, and discharged under a one-time UPDES permit. Following the VEFR event, Terracon conducted injection events into 44 monitoring / injection wells for a total of three nutrient injections and two BioRem injections over a five-week period. TPH-DRO concentrations were reduced by 54% during the 35 day pilot test. Following the successful completion of the pilot test, Terracon was approved by the State to conduct full-scale remediation at the site. Upon approval from the state, approximately 280 tons of impacted soils were removed from the areas near dispensers. Free product (diesel) was discovered in several monitoring area surrounding the diesel tank farm. Injections were conducted on the site for approximately three years, after which Terracon was able to achieve no further action status for the release.

9th Street Marketplace Shopping Center – Former San Marcos Property, Murray, Utah
The site was a former corner gasoline service station that was abandoned in the late 1960s. A local developer purchased the property with plans to develop the site within 180 days. Terracon conducted a Limited Site Investigation and it was determined that the soil and groundwater at the site were impacted with gasoline, used oil, and diesel constituents above Initial Screening Levels. In addition, trichloroethene (TCE) was detected above EPA National Primary Drinking Water Standards in a groundwater monitoring well on the perimeter of the site. It was later determined that the TCE had migrated on to the site from a nearby dry cleaners. Terracon met with members of the Division of Solid and Hazardous Waste to discuss the chlorinated solvents in the groundwater, and devised a remediation plan to address the impacted soils and groundwater on the site. There was additional collaboration with the Division of Environmental Response and Remediation (DERR) on this remediation approach due to the petroleum hydrocarbons impacts and former USTs on the site. Due to the short time-frame for development, Terracon used a "dig and haul" approach to remediate the site. Approximately 1,150 tons of petroleum-impacted soils were excavated and disposed at ET Technologies Soil Regeneration site for land farming. Upon completion of remediation services, the site received a No Further Action letter from the DERR for the Leaking Underground Storage Tank (LUST) release. The DSHW provided a letter indicating that the TCE contamination appeared to be from an off-site source and no additional sampling was necessary.

Tesoro #40 – South Salt Lake, Utah
A release was discovered following the closure of three USTs in April 2008. Terracon is providing ongoing services for site characterization, vapor intrusion evaluation, groundwater monitoring and remediation. Using a phased site investigation approach, Terracon defined the vertical and lateral extent of impact to subsurface soils and groundwater. The site investigation determined that constituent concentrations exceeding applicable action levels (Tier 1 Screening Levels and Initial Screening Levels) extend from the source area down gradient to adjacent off-site properties. Of particular concern is an adjacent residential apartment building (down gradient from the source area) where elevated gasoline constituent concentrations are present in underlying soils and groundwater. To assess vapor intrusion (VI) potential, Terracon worked closely with DERR representatives (who are using this site as a VI case study) to conduct quarterly rounds of sub-slab soil vapor sampling through the basement floor of both of the affected apartments. This intrusive activity required proactive public relations directly with the affected apartment residents. The vapor analytical results were compared to risk-based screening levels (RBSLs) for indoor air, which Terracon calculated using the procedures in DERR's Guidelines for Utah's Corrective Action Process. The results indicated vapor concentrations below the calculated RBSLs, and therefore are not contributing to excess risk to the apartment residents. Terracon developed a Corrective Action Plan (CAP) including a detailed remedial alternatives evaluation, selection of the preferred remedy, and remedial design. The selected remedy involves in-situ anaerobic bioremediation along with source removal and disposal. The CAP was approved by DERR in 2010 and Terracon directed the removal of impacted soils in the area of the former USTs and installed a network of 30 injection wells on the site and adjoining residential property for the injection of an anaerobic oil digester. To date, Terracon has directed 18 injection events, and benzene concentrations have been reduced by more than 85% since the initiation of corrective action on the site.

Construction Truck and Trailer – Salt Lake City, Utah
Project Manager for the ongoing investigation/remediation project after a diesel UST and new oil AST leaked on the site. Mr. Bowers conducted a Limited Site Investigation and identified TRPH and diesel constituents above regulatory limits in the soil and groundwater of the site. Several of the wells located between the existing shop area and former UST had measurable levels of free product (new oil) in the wells. Terracon directed the excavation of an area approximately 90' x 90' x 8' and 2,442 tons of impacted soil were disposed at a permitted disposal facility. Terracon is currently awaiting the approval of a Corrective Action Plan from the DERR and intends to remediate the remaining "hot spots" of soil and groundwater contamination that could not be excavated due to physical barriers on the site, (existing building and property fence line) with an anaerobic oil digester.

Brent Brown Chevrolet – Provo, Utah
As part of a property transaction, Terracon conducted a subsurface investigation in the service area of the Brent Brown Chevrolet and discovered that several underground hydraulic hoists had leaked and impacted the soil and groundwater of the site. Terracon directed the removal of the leaking hoists and excavated an area approximately 90'x25'x8' and removed the impacted soils for off-site disposal. Once the excavation was complete, approximately 2,000 gallons of free product (hydraulic oil) was removed from the groundwater surface within the excavation with a vacuum truck. Ten injection wells were installed within the impacted area for injections of BioRem 2000® oil digester. Twelve injection events were conducted over a one-year time-frame. Following the injection events, groundwater levels were reported below regulatory cleanup levels and a no further action letter was issued by the Utah Department of Water Quality.

SITE INVESTIGATION

The Scoular Company – Utah
As part of a property transaction, conducted an extensive subsurface investigation, including the delineation of a trichloroethylene (TCE) groundwater plume that migrated off the grain-handling facility site impacting an adjoining industrial park. The TCE plume is currently listed on the CERCLIS database as the "Ogden Industrial Park Plume." Mr. Bowers is currently providing the client litigation support and document review for additional site remediation efforts conducted by the previous owner's consultant.

The Scoular Company – Southeastern Idaho
Terracon conducted subsurface investigations on four grain-handling facilities in southeastern Idaho. Phase I ESAs previously conducted on the sites indicated the potential of soil and groundwater contamination from carbon tetrachloride that was used at one of the sites and potentially used at the others. Analytical results from the subsurface investigation were compared to the proper State of Utah, Federal and Idaho DEQ Risk Screening Process.

Merit Oil – Kansas, Colorado, and Oklahoma
Involved in a Modified Phase I ESA portfolio, including 2,604 oil and gas production locations, injection and disposal well locations, central tank batteries, and compressor stations in southwest Kansas, southeast Colorado, and northwest Oklahoma. Duties included field reconnaissance, NORM surveys, and reporting.

Associated Foods Stores – Salt Lake City, Utah
Project Manager for remediation efforts of a soil, groundwater, and free-phase product cleanup. The site was previously used as a fleet truck repair and refueling center. Site remediation activities included a pump and treat system, air sparging, free product recovery, and extensive soil excavations.

Richmond American Homes – South Jordan, Utah
Completed numerous limited site investigations to evaluate the presence of lead and arsenic in the on-site soils/fills for more than 250 residential lots within the Kennecott Land Daybreak development. Terracon conducted X-ray fluorescence (XRF) screening measurements on soil/fill samples to identify target samples for laboratory testing.

All Resort Coach, Inc. DBA Lewis Stages – Salt Lake City, Utah
Terracon conducted a Phase I ESA and limited site investigation as part of a property transaction. The limited site investigation revealed the presence of soil and groundwater contamination from existing underground storage tanks (USTs) above regulatory limits. Terracon directed efforts for the removal of three USTs, the contaminated soil removal and the repair of existing USTs to meet State of Utah standards and achieve regulatory closure.

APPENDIX F
DESCRIPTION OF TERMS AND ACRONYMS

Description of Selected General Terms and Acronyms

Term/Acronym	*Description*
ACM	Asbestos Containing Material. Asbestos is a naturally occurring mineral, three varieties of which (chrysotile, amosite, crocidolite) have been commonly used as fireproofing or binding agents in construction materials. Exposure to asbestos, as well as ACM, has been documented to cause lung diseases including asbestosis (scarring of the lung), lung cancer and mesothelioma (a cancer of the lung lining). Regulatory agencies have generally defined ACM as a material containing greater that one (1) percent asbestos, however some states (e.g. California) define ACM as materials having 0.1% asbestos. In order to define a homogenous material as non-ACM, a minimum number of samples must be collected from the material dependent upon its type and quantity. Homogenous materials defined as non-ACM must either have 1) no asbestos identified in all of its samples or 2) an identified asbestos concentration below the appropriate regulatory threshold. Asbestos concentrations are generally determined using polarized light microscopy or transmission electron microscopy. Point counting is an analytical method to statistically quantify the percentage of asbestos in a sample. The asbestos component of ACM may either be friable or non-friable. Friable materials, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure and have a higher potential for a fiber release than non-friable ACM. Non-friable ACM are materials that are firmly bound in a matrix by plastic, cement, etc. and, if handled carefully, will not become friable. Federal and state regulations require that either all suspect building materials be presumed ACM or that an asbestos survey be performed prior to renovation, dismantling, demolition, or other activities that may disturb potential ACM. Notifications are required prior to demolition and/or renovation activities that may impact the condition of ACM in a building. ACM removal may be required if the ACM is likely to be disturbed or damaged during the demolition or renovation. Abatement of friable or potentially friable ACM must be performed by a licensed abatement contractor in accordance with state rules and NESHAP. Additionally, OSHA regulations for work classification, worker training and worker protection will apply.
AHERA	Asbestos Hazard Emergency Response Act
AST	Aboveground Storage Tanks. ASTs are generally described as storage tanks less than 10% of which are below ground (i.e., buried). Tanks located in a basement, but not buried, are also considered ASTs. Whether, and the extent to which, an AST is regulated, is determined on a case-by-case basis and depends upon tank size, its contents and the jurisdiction of its location.
BGS	Below Ground Surface
Brownfields	State and/or tribal listing of Brownfield properties addressed by Cooperative Agreement Recipients or Targeted Brownfields Assessments.
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes. BTEX are VOC components found in gasoline and commonly used as analytical indicators of a petroleum hydrocarbon release.
CERCLA	Comprehensive Environmental Response, Compensation and Liability Act (a.k.a. Superfund). CERCLA is the federal act that regulates abandoned or uncontrolled hazardous waste sites. Under this Act, joint and several liability may be imposed on potentially responsible parties for cleanup-related costs.
CERCLIS	Comprehensive Environmental Response, Compensation and Liability Information System. An EPA compilation of sites having suspected or actual releases of hazardous substances to the environment. CERCLIS also contains information on site inspections, preliminary assessments and remediation of hazardous waste sites. These sites are typically reported to EPA by states and municipalities or by third parties pursuant to CERCLA Section 103.
CESQG	Conditionally Exempt Small Quantity Generators
CFR	Code of Federal Regulations

Description of Selected General Terms and Acronyms

Term/Acronym	*Description*
CREC	Controlled Recognized Environmental Condition is defined in ASTM E1527-13 as "a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority) , with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). A condition considered by the environmental professional to be a controlled recognized environmental condition shall be listed in the findings section of the Phase I Environmental Site Assessment report, and as a recognized environmental condition in the conclusions section of the Phase I Environmental Site Assessment report."
DOT	U.S. Department of Transportation
EPA	U.S. Environmental Protection Agency
ERNS	Emergency Response Notification System. An EPA-maintained federal database which stores information on notifications of oil discharges and hazardous substance releases in quantities greater than the applicable reportable quantity under CERCLA. ERNS is a cooperative data-sharing effort between EPA, DOT, and the National Response Center.
ESA	Environmental Site Assessment
FRP	Fiberglass Reinforced Plastic
Hazardous Substance	As defined under CERCLA, this is (A) any substance designated pursuant to section 1321(b)(2)(A) of Title 33, (B) any element, compound, mixture, solution, or substance designated pursuant to section 9602 of this title; (C) any hazardous waste having characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Act (with some exclusions); (D) any toxic pollutant listed under section 1317(a) of Title 33; (E) any hazardous air pollutant listed under section 112 of the Clean Air Act; and (F) any imminently hazardous chemical substance or mixture with respect to which the EPA Administrator has taken action under section 2606 of Title 15. This term does not include petroleum, including crude oil or any fraction thereof which is not otherwise listed as a hazardous substance under subparagraphs (A) through (F) above, and the term include natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas).
Hazardous Waste	This is defined as having characteristics identified or listed under section 3001 of the Solid Waste Disposal Act (with some exceptions). RCRA, as amended by the Solid Waste Disposal Act of 1980, defines this term as a "solid waste, or combination of solid wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may (A) cause, or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible illness; or (B) pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of, or otherwise managed."
HREC	Historical Recognized Environmental Condition is defined in ASTM E1527-13 as "a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted residential use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). Before calling the past release a historical recognized environmental condition, the environmental professional must determine whether the past release is a recognized environmental condition at the time of the Phase I Environmental Site Assessment is conducted (for example, if there has been a change in the regulatory criteria). If the EP considers the past release to be a recognized environmental condition at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a recognized environmental condition."
IC/EC	A listing of sites with institutional and/or engineering controls in place. IC include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls. EC include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.
ILP	Innocent Landowner/Operator Program
LQG	Large Quantity Generators
LUST	Leaking Underground Storage Tank. This is a federal term set forth under RCRA for leaking USTs. Some states also utilize this term.

Description of Selected General Terms and Acronyms

Term/Acronym	*Description*
MCL	Maximum Contaminant Level. This Safe Drinking Water concept (and also used by many states as a ground water cleanup criteria) refers to the limit on drinking water contamination that determines whether a supplier can deliver water from a specific source without treatment.
MSDS	Material Safety Data Sheets. Written/printed forms prepared by chemical manufacturers, importers and employers which identify the physical and chemical traits of hazardous chemicals under OSHA's Hazard Communication Standard.
NESHAP	National Emissions Standard for Hazardous Air Pollutants (Federal Clean Air Act). This part of the Clean Air Act regulates emissions of hazardous air pollutants.
NFRAP	Facilities where there is "No Further Remedial Action Planned," as more particularly described under the Records Review section of this report.
NOV	Notice of Violation. A notice of violation or similar citation issued to an entity, company or individual by a state or federal regulatory body indicating a violation of applicable rule or regulations has been identified.
NPDES	National Pollutant Discharge Elimination System (Clean Water Act). The federal permit system for discharges of polluted water.
NPL	The NPL is the EPA's database of uncontrolled or abandoned hazardous waste facilities that have been listed for priority remedial actions under the Superfund Program.
OSHA	Occupational Safety and Health Administration or Occupational Safety and Health Act
PACM	Presumed Asbestos-Containing Material. A material that is suspected of containing or presumed to contain asbestos but which has not been analyzed to confirm the presence or absence of asbestos.
PCB	Polychlorinated Biphenyl. A halogenated organic compound commonly in the form of a viscous liquid or resin, a flowing yellow oil, or a waxy solid. This compound was historically used as dielectric fluid in electrical equipment (such as electrical transformers and capacitors, electrical ballasts, hydraulic and heat transfer fluids), and for numerous heat and fire sensitive applications. PCB was preferred due to its durability, stability (even at high temperatures), good chemical resistance, low volatility, flammability, and conductivity. PCBs, however, do not break down in the environment and are classified by the EPA as a suspected carcinogen. 1978 regulations, under the Toxic Substances Control Act, prohibit manufacturing of PCB-containing equipment; however, some of this equipment may still be in use today.
pCi/L	picoCuries per Liter of Air. Unit of measurement for Radon and similar radioactive materials.
PLM	Polarized Light Microscopy (see ACM section of the report, if included in the scope of services)
PST	Petroleum Storage Tank. An AST or UST that contains a petroleum product.
Radon	A radioactive gas resulting from radioactive decay of naturally-occurring radioactive materials in rocks and soils containing uranium, granite, shale, phosphate, and pitchblende. Radon concentrations are measured in picoCuries per Liter of Air. Exposure to elevated levels of radon creates a risk of lung cancer; this risk generally increases as the level of radon and the duration of exposure increases. Outdoors, radon is diluted to such low concentrations that it usually does not present a health concern. However, radon can accumulate in building basements or similar enclosed spaces to levels that can pose a risk to human health. Indoor radon concentrations depend primarily upon the building's construction, design and the concentration of radon in the underlying soil and ground water. The EPA recommended annual average indoor "action level" concentration for residential structures is 4.0 pCi/l.
RCRA	Resource Conservation and Recovery Act. Federal act regulating solid and hazardous wastes from point of generation to time of disposal ('cradle to grave"). 42 U.S.C. 6901 et seq.
RCRA Generators	The RCRA Generators database, maintained by the EPA, lists facilities that generate hazardous waste as part of their normal business practices. Generators are listed as either large (LQG), small (SQG), or conditionally exempt (CESQG). LQG produce at least 1000 kg/month of non-acutely hazardous waste or 1 kg/month of acutely hazardous waste. SQG produce 100-1000 kg/month of non-acutely hazardous waste. CESQG are those that generate less than 100 kg/month of non-acutely hazardous waste.
RCRA CORRACTS/TSDs	The USEPA maintains a database of RCRA facilities associated with treatment, storage, and disposal (TSD) of hazardous materials which are undergoing "corrective action". A "corrective action" order is issued when there is a release of hazardous waste or constituents into the environment from a RCRA facility.
RCRA Non-CORRACTS/TSDs	The RCRA Non-CORRACTS/TSD Database is a compilation by the USEPA of facilities which report storage, transportation, treatment, or disposal of hazardous waste. Unlike the RCRA CORRACTS/TSD database, the RCRA Non-CORRACTS/TSD database does not include RCRA facilities where corrective action is required.

Description of Selected General Terms and Acronyms

Term/Acronym	*Description*
RCRA Violators List	RAATS. RCRA Administrative Actions Taken. RAATS information is now contained in the RCRIS database and includes records of administrative enforcement actions against facilities for noncompliance.
RCRIS	Resource Conservation and Recovery Information System, as defined in the Records Review section of this report.
REC	Recognized Environmental Conditions are defined by ASTM E1527-13 as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: 1) due to any release to the environment; 2) under conditions indicative of a release to the environment. *De minimis* conditions are not recognized environmental conditions."
SCL	State "CERCLIS" List (see SPL /State Priority List, below).
SPCC	Spill Prevention, Control and Countermeasures. SPCC plans are required under federal law (Clean Water Act and Oil Pollution Act) for any facility storing petroleum in tanks and/or containers of 55-gallons or more that when taken in aggregate exceed 1,320 gallons. SPCC plans are also required for facilities with underground petroleum storage tanks with capacities of over 42,000 gallons. Many states have similar spill prevention programs, which may have additional requirements.
SPL	State Priority List. State list of confirmed sites having contamination in which the state is actively involved in clean up activities or is actively pursuing potentially responsible parties for clean up. Sometimes referred to as a State "CERCLIS" List.
SQG	Small Quantity Generator
SWF/LF	State and/or Tribal database of Solid Waste/Landfill facilities. The database information may include the facility name, class, operation type, area, estimated operational life, and owner.
TPH	Total Petroleum Hydrocarbons
TRI	Toxic Release Inventory. Routine EPA report on releases of toxic chemicals to the environment based upon information submitted by entities subject to reporting under the Emergency Planning and Community Right to Know Act.
TSCA	Toxic Substances Control Act. A federal law regulating manufacture, import, processing and distribution of chemical substances not specifically regulated by other federal laws (such as asbestos, PCBs, lead-based paint and radon). 15 U.S.C 2601 et seq.
USACE	United States Army Corps of Engineers
USC	United States Code
USGS	United States Geological Survey
USNRCS	United States Department of Agriculture-Natural Resource Conservation Service
UST	Underground Storage Tank. Most federal and state regulations, as well as ASTM E1527-13, define this as any tank, incl., underground piping connected to the tank, that is or has been used to contain hazardous substances or petroleum products and the volume of which is 10% or more beneath the surface of the ground (i.e., buried).
VCP	State and/or Tribal facilities included as Voluntary Cleanup Program sites.
VOC	Volatile Organic Compound

Description of Selected General Terms and Acronyms

Term/Acronym	*Description*
Wetlands	Areas that are typically saturated with surface or ground water that creates an environment supportive of wetland vegetation (i.e., swamps, marshes, bogs). The Corps of Engineers Wetlands Delineation Manual (Technical Report Y-87-1) defines wetlands as areas inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. For an area to be considered a jurisdictional wetland, it must meet the following criteria: more than 50 percent of the dominant plant species must be categorized as Obligate, Facultative Wetland, or Facultative on lists of plant species that occur in wetlands; the soil must be hydric; and, wetland hydrology must be present. The federal Clean Water Act which regulates "waters of the US," also regulates wetlands, a program jointly administered by the USACE and the EPA. Waters of the U.S. are defined as: (1) waters used in interstate or foreign commerce, including all waters subject to the ebb and flow of tides; (2) all interstate waters including interstate wetlands; (3) all other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, etc., which the use, degradation, or destruction could affect interstate/ foreign commerce; (4) all impoundments of waters otherwise defined as waters of the U. S., (5) tributaries of waters identified in 1 through 4 above; (6) the territorial seas; and (7) wetlands adjacent to waters identified in 1 through 6 above. Only the USACE has the authority to make a final wetlands jurisdictional determination.

Terracon Project No. 61177082

Dear Mr. Matthes:

Terracon Consultants, Inc. (Terracon) is pleased to submit our report for Phase II Site Investigation activities completed at the above-referenced site. EPA approved this site for eligibility under a Site Eligibility Determination Outline (EPA Region 8, August 22, 2017). The report presents data from field activities that included the installation of soil borings for the collection of soil and groundwater samples, and the installation of sub-slab vapor sampling ports for the collection of sub-slab vapor samples. This investigation was approved by EPA under Cooperative Agreement #96835701 for Hazardous Substances commingled with Petroleum. The assessment was guided by a Sampling and Analysis Plan reviewed, amended and approved by EPA (May 1, 2018). Quality of data was guided by the EPA-approved Quality Assurance Project Plan, Revision 2 (Terracon; May 24, 2018).

Terracon appreciates this opportunity to provide environmental support services to Salt Lake County. Should you have any questions or require additional information, please do not hesitate to contact our office.

Sincerely,

Terracon Consultants, Inc.

SALT LAKE COUNTY BROWNFIELDS ASSESSMENT
EPA COOPERATIVE AGREEMENT NO. 96835701
HAZARDOUS MATERIALS AND PETROLEUM GRANT FOR
SALT LAKE COUNTY
SCHOVAERS ELECTRONICS
22 SOUTH JEREMY STREET, SALT LAKE CITY, UTAH
ACRES ID #199723

Terracon Project No. 61177082
August 13, 2018
Revised November 1, 2018
Final Version Issued January 9, 2019

1.0 INTRODUCTION

Terracon Consultants, Inc. (Terracon) has completed a Phase II Site Investigation at the Schovaers Electronics site, located at 22 South Jeremy Street, Salt Lake City, Utah, as described in the approved Sampling and Analysis Plan, dated May 1, 2018. This Phase II Site Investigation was completed with funding from the Salt Lake County Brownfields Assessment Grant.

1.1 Brownfields Setting

Salt Lake County (the Grantee) is a recipient of an EPA community-wide assessment grant to inventory, characterize, assess, and conduct cleanup planning along with public outreach activities for eligible Brownfield sites located within County boundaries.

The Schovaers Electronics site is identified in EPA's online Assessment, Cleanup and Redevelopment Exchange System (ACRES) as Number 199723. This property was approved for assessment by EPA under a Site Eligibility Determination Outline (EPA Region 8, August 22, 2017), designated as hazardous substances commingled with petroleum[1].

As part of the previous Salt Lake City North Temple Brownfields Assessment Grant, Terracon conducted a Phase I Environmental Site Assessment (ESA) on the site (Terracon, 2015) and an Asbestos and Hazardous Materials Survey (Terracon, 2016) was conducted to identify any material that may require special handling or disposal requirements during demolition. In

[1] *Previous assessments of this property as part of Salt Lake City's Assessment Grant (#96809601) were conducted under an earlier Site Eligibility Determination Outline (SEDO) dated February 6, 2015, which had indicated Hazardous Substances as the known or suspected contaminant(s). The 2017 SEDO for this property, prepared by Salt Lake County under its Assessment Grant (#96835701), indicated the known or suspected contaminant(s) as Hazardous Substances commingled with Petroleum, although petroleum contamination has not been identified as a concern at the property.*

response to the Recognized Environmental Conditions (RECs) identified in the Phase I ESA, a Phase II ESA was performed under the grant by Terracon (Terracon, 2016). A second Phase I ESA was initiated in 2017 (Terracon, 2018) that recommended an additional site investigation be conducted to assess the vertical and horizontal impacts identified in the 2016 Phase II ESA. Definition of impacted soils and groundwater will be used to develop remedial strategies and/or management plans for future re-development of the property.

This supplemental Phase II Site Assessment was guided by a Sampling and Analysis Plan (SAP) reviewed, amended and approved by EPA (May 1, 2018). Quality of assessment data was guided by the SAP and EPA-approved Quality Assurance Project Plan (QAPP), (Revision 2, May 24, 2018).

1.2 Site Description and Background

Site Name	Schovaers Electronics (the site)
Site Location/Address	22 South Jeremy Street, Salt Lake City, Utah
ACRES ID #	199723
General Site Description and Use	The site is an approximately 0.34-acre parcel (Parcel ID #15-02-204-007). An approximately 6,000-square-foot industrial building occupies the site. An approximately 672-square-foot garage is present on the northwest side of the site. Paved parking areas are located to the east and north of the building. A small weedy area is present on the western boundary area. The building is currently vacant.

Terracon conducted an initial Phase I Environmental Site Assessment (ESA) on the site in 2015. The Phase I ESA was compliant with Brownfields All Appropriate Inquiry and was performed in conformance with the scope and limitations of American Society for Testing and Materials (ASTM) Practice E1527-13 for the parcel located at 22 South Jeremy Street in Salt Lake City, Salt Lake County, Utah. The purpose of the Phase I ESA was to identify RECs in connection with the site, including the building and other improvements located on the site at the time of the reconnaissance. Terracon's 2015 Phase I ESA identified multiple RECs in connection with the property, and recommended a Phase II ESA be conducted to determine if the identified RECs had impacted the soils or groundwater at the site.

Terracon conducted the recommended Phase II ESA in 2015. The investigation identified soil impacts in the form of hexavalent chromium in shallow soils across the site. Concentrations of trichloroethene (TCE) and dissolved hexavalent chromium were reported in groundwater samples. The concentrations of dissolved hexavalent chromium appeared to be highest on the western side of the property. However, both TCE and hexavalent chromium were reported at sample locations along the northern property boundary. These results suggested that an off-site source of contamination may be present. The current investigation also encountered soil and groundwater impacts that appear to have emanated from on-site historical operations.

A second Phase I ESA was initiated in 2017 (Terracon, 2018) that recommended an additional Phase II ESA be conducted to assess the vertical and horizontal extent of impacts to soils and the potential for migration of groundwater impacts onto the property reported in the 2015 Phase II ESA.

1.3 Standard of Care

Terracon's services were performed in a manner consistent with generally accepted practices of the profession undertaken in similar studies in the same geographical area during the same time. Terracon makes no warranties, either express or implied, regarding the findings, conclusions, or recommendations. Please note that Terracon does not warrant the work of laboratories, regulatory agencies, or other third parties supplying information used in the preparation of the report. These Phase II services were performed in accordance with the scope of work agreed with you, our client, as reflected in our proposal and consistent with ASTM E1903-11, *Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment.*

1.4 Additional Scope Limitations

Findings, conclusions, and recommendations resulting from these services are based upon information derived from the on-site activities and other services performed under this scope of work; such information is subject to change over time. Certain indicators of the presence of hazardous substances, petroleum products, or other constituents may have been latent, inaccessible, unobservable, non-detectable, or not present during these services. We cannot represent that the site contains no hazardous substances, toxic materials, petroleum products, or other latent conditions beyond those identified during this Phase II investigation. Subsurface conditions may vary from those encountered at specific borings or wells or during other surveys, tests, assessments, investigations, or exploratory services. The data, interpretations, findings, and our recommendations are based solely upon data obtained at the time and within the scope of these services.

1.5 Reliance

This report has been prepared for the exclusive use of Salt Lake County. Any authorization for use or reliance by any other party (except a governmental entity having jurisdiction over the site) is prohibited without the express written authorization of Salt Lake County and Terracon. Reliance by authorized parties will be subject to the terms, conditions, and limitations stated in the underlying contract between Salt Lake County and Terracon. The limitation of liability defined in the terms and conditions is the aggregate limit of Terracon's liability all relying parties unless otherwise agreed in writing.

2.0 PHASE II SITE INVESTIGATION

2.1 Scope

The proposed Phase II scope of work described in the SAP was intended to gather the necessary data to bridge the gaps identified in the Terracon 2016 Phase II ESA, the Terracon 2017 Phase I ESA, and to aid with providing the information needed to develop an Analysis of Brownfield Cleanup Alternatives (ABCA) for the site. These activities were conducted in accordance with a site-specific Sampling and Analysis Plan (SAP, Terracon 2018) that was prepared and approved by EPA for this site. The SAP established specific site objectives, sampling process design, and details regarding site-specific sampling and analyses, and was used in conjunction with the EPA-approved Quality Assurance Project Plan (QAPP, Terracon 2018).

2.2 Sampling Process Design

The sampling strategy for soil, groundwater, and soil vapor was designed to assess the vertical and horizontal extent of impacts to soils or groundwater at the site in order to augment the previous data as needed to develop cleanup planning documents for the site. Exterior borings were designed to assess the vertical extent of hexavalent chromium in areas where concentrations during the previous investigation were reported above the EPA Regional Screening Levels (RSLs). The interior borings were designed to assess the soil conditions below the building for the presence of metals and volatile organic compounds (VOCs) in both soil and groundwater.

Nine (9) soil borings (SE-SB-16 to 24) were advanced using direct-push drilling equipment to allow for the collection of subsurface soil and groundwater samples. The drilling and sampling locations are depicted on Exhibits 2 and 3; Appendix A. The soil borings were advanced to a maximum depth of approximately 16 feet below grade surface (bgs) to allow for sufficient water to collect groundwater samples. After sample collection was completed, each boring was properly abandoned by backfilling with bentonite clay pellets, adding water to hydrate the bentonite clay, and restoring the surface with native soil, asphalt, or concrete patch as appropriate to match the surrounding area. Samples were delivered to the analytical laboratory within holding times for all analytical methods to generate definitive analytical data, which are critical to this assessment.

Four (4) sub-slab soil vapor points were installed inside the building to allow for the collection of sub-slab soil vapor samples to assess the potential for vapor intrusion.

Tables 1 and 2 provide a summary description of the sample locations, sample types, sample naming convention, laboratory analyses, and sampling rationale.

TABLE 1 – SUMMARY OF SOIL BORINGS

Sample Location	Rationale	Sample IDs	Sample Matrix	Analytes
Northeast corner of property (exterior of building)	Area where Cr (VI) was found above RSLs, assess vertical soil impacts	SE-SB-16 2.5 ft SE-SB-16 5 ft SE-SB-16 7.5 ft SE-SB-16 10 ft	SS SS SS (Hold) SS (Hold)	Cr(VI), pH
Southwest corner of property (exterior of building)	Area where Cr (VI) was found above RSLs, assess vertical soil impacts	SE-SB-17 2.5 ft SE-SB-17 5 ft SE-SB-17 7.5 ft SE-SB-17 10 ft	SS SS SS (Hold) SS (Hold)	Cr(VI), pH
		SE-SB-17 GW*	GW	13 PP Metals[a], Cr(VI), VOCs[b], pH
Drill Press/ Router Room (interior of building)	Assess Northwest corner of building	SE-SB-18 3 ft SE-SB-18 8 ft	SS SS	13 PP Metals[a], Cr(VI), VOCs[b], pH
		SE-SB-18 GW	GW	13 PP Metals[a], Cr(VI), VOCs[b], pH
Washout Booth (interior of building)	Assess Northeast corner of building	SE-SB-19 4 ft SE-SB-19 8 ft	SS SS	13 PP Metals[a], Cr(VI), VOCs[b], pH
		SE-SB-19-GW	GW	13 PP Metals[a], Cr(VI), VOCs[b], pH
General area/sewer lateral and effluent sample location (interior of building)	Boring adjacent to sewer lateral and effluent collection point	SE-SB-20 3 ft SE-SB-20 11 ft	SS SS	13 PP Metals[a], Cr(VI), VOCs[b], pH
		SE-SB-20 GW	GW	13 PP Metals[a], Cr(VI), VOCs[b], pH

* - Sample not included in the SAP.

TABLE 2
SUMMARY OF SUB-SLAB SOIL GAS SAMPLING

Sample Location	Rationale	Sample IDs	Sample Matrix	Analytes
Northwest part of building (interior of building)	Assess vapor intrusion potential	SE-VP-1	Soil Gas	VOCs[a]
Northeast part of building (interior of building)	Assess vapor intrusion potential	SE-VP-2	Soil Gas	VOCs[a]
Adjacent to sewer lateral (interior of building)	Assess vapor intrusion potential	SE-VP-3	Soil Gas	VOCs[a]
Plate Room (interior of building)	Assess vapor intrusion potential	SE-VP-4	Soil Gas	VOCs[a]

a – volatile organic compounds.

2.3 Field Data Collection

Following SAP approval, the public utility location service (Blue Stakes of Utah) was notified at least 48 hours prior to commencing any drilling activities. A private utility location service was

used to locate potential utilities or other subsurface obstacles in the immediate vicinity of each boring location.

On May 17 and 18, 2018, Terracon mobilized to the site to advance the borings. The mechanized drilling services were performed by a Utah-licensed well driller; Terracon environmental personnel directed and supervised the drilling activities, logged the soil borings, and collected field samples.

During advancement of the soil borings, soils were continuously cored in 5-foot intervals and observed to document subsurface soil types, color, relative moisture content, and sensory evidence of environmental impacts. The soil samples were field-screened using a portable photoionization detector (PID) – Mini Rae 3000 PID equipped with a 10.6 eV ultraviolet lamp to evaluate the potential presence of total volatile organic compounds (TVOCs). The unit measures TVOCs in sample headspace air relative to parts per million calibration gas equivalents in air and identified simply as “PPM” on soil boring logs.

The SAP identified boring SE-SB-24 for the collection of a groundwater sample. After boring installation, the borehole collapsed and a groundwater sample could not be collected. A second attempt was made to re-drill the boring, but it was unsuccessful. A groundwater sample was collected from boring SE-SB-17 in substitution.

Fill was encountered in several of the borings extending to depths up to 7.5 feet bgs. Soil boring SE-SB-21 encountered black staining from 6.5 to 9.5 feet bgs. Native soils consisted of silts and clays and silty sand and sand. Groundwater was encountered at approximately 9 to 13 feet bgs. PID readings ranges from 0 to 6.3 ppm, with the highest observed reading recorded in boring SE-SB-21 @ 7 feet bgs. Detailed lithological descriptions and PID readings are included on the soil boring logs provided in Appendix B. The 2016 subsurface established a groundwater gradient across the property as being to the west-southwest.

2.4 Soil Sampling

Soil samples were collected from direct-push borings following the procedures detailed in Standard Operating Procedure (SOP) 5, *Geoprobe Sampling*, which is provided in Appendix B of the EPA-approved QAPP.

- Sample locations SE-SB-16 and SE-SB-17 (Exterior): Four soil samples were collected from each boring at the predetermined depths of 2.5’, 5’, 7.5’ and 10’ bgs for vertical delineation of hexavalent chromium in soils.

- Sample locations SE-SB-18 through SE-SB-24 (Interior): Two soil samples were collected from each boring. One soil sample was collected from soil exhibiting the most elevated PID readings. Where no elevated PID reading was observed, one

sample was collected at approximately 3' below the floor slab, and the second sample between 7 to 11' bgs based on field observations.

2.5 Groundwater Sampling

Groundwater samples were collected from seven borings following the procedures detailed in SOP 5, *Geoprobe Sampling* located in Appendix B of the QAPP.

- Sample locations SE-SB-17, -18, -19, -20, -21, -22, -23.

2.6 Soil Gas Probe Installation

Sub-slab vapor samples were collected from four vapor pins installed within the concrete floor slab, following the procedures detailed in SOP-E.2120, *Soil Gas Sampling* – Sub-slab Pin Method located in Appendix C of the SAP.

2.7 Field QA/QC Samples

Field duplicate samples for soil and groundwater were collected at a rate of 10 percent. For this investigation, two field duplicate soil and one field duplicate groundwater samples were collected. The duplicates were given a fictitious identification so that the laboratory would be unaware of their duplicate status. The two borings selected for duplicate soil sampling were SE-SB-17 (duplicate sample ID SE-SB-27) and SE-SB-24 (duplicate sample ID SE-SB-34). The groundwater duplicate sample was collected from SE-SB-22 (duplicate sample ID SE-SB-32). Field duplicates for sub-slab vapor samples were not planned.

One trip blank (laboratory supplied blank) was specified for this site. The sample was included in the shipment with the samples submitted for analysis of VOCs.

2.8 Equipment Decontamination

Non-expendable sampling equipment was decontaminated at the beginning of the project and decontaminated between each sampling location. These items were hand-scrubbed in an Alconoxä and potable water solution and rinsed with potable water between sample locations. Drilling equipment was cleaned using a high-pressure washer prior to beginning the project and between boring locations.

2.9 Site Restoration

After sample collection was completed, each boring was properly abandoned by backfilling with bentonite clay pellets, adding water to hydrate the bentonite clay, and restoring the surface with existing soil, asphalt, or concrete patch as appropriate to match the surrounding area.

3.0 LABORATORY ANALYTICAL METHODS

All soil and groundwater samples (including field duplicates and trip blanks) were placed in iced coolers. The samples were shipped in iced coolers under chain-of-custody protocols via overnight courier to Environmental Science Corporation (ESC) analytical laboratory in Mt. Juliet, Tennessee (a Utah-Certified Laboratory).

The soil gas sample canisters were placed back into laboratory-supplied shipping containers and shipped under chain-of-custody protocols via overnight courier to ESC.

Samples were analyzed using the following methods:

TABLE 2 – ANALYTICAL METHOD SUMMARY

Parameter	Matrix (Solid/Liquid)	Analytical Method	No. of Samples[1]
VOCs	Soil	SW-846 8260B	15
VOCs	Groundwater	SW-846 8260B	8
VOCs	Soil Gas	TO-15	4
Metals - Priority Pollutants + Cr(VI)	Soil	SW-846 6010B, 3060A/7196A, 7471	15
Cr(VI)	Soil	SW-846 3060A/7196A	5
Metals (13 Priority Pollutants)	Groundwater	SW-846 6010B, 6020B, 6020	8
Cr(VI)	Groundwater	SW-846 218.6, 7199	8
pH	Soil	SW-846 9045D	15
pH	Groundwater	Field test	8

[1]Includes field duplicate samples.

4.0 SUMMARY OF ANALYTICAL RESULTS

The following sections summarize analytical results. Comparative screening levels were listed in the approved SAP; however, since the date of the SAP approval, the US EPA has issued updated Regional Screening Levels (RLSs; May 2018). These updated RSLs are shown in the summary tables. Utah DEQ comparative screening levels remain unchanged. A summary of the analytical results is provided in Tables C1 through C5 (Appendix C). Copies of the ESC analytical reports and sample chain-of-custody records are provided in Appendix D.

Constituent concentrations in soils were compared to current EPA RSLs for residential and industrial use scenarios, and to Utah Department of Environmental Quality (UDEQ) Leaking Underground Storage Tank (LUST) Initial Screening Levels (ISLs). Constituent concentrations in

groundwater were compared to EPA RSLs for tap water, UDEQ-LUST ISLs, Utah Ground Water Quality Protection Standards (UGWQPS; UAC-R317-6-2.1), EPA Maximum Contaminant Levels (MCLs) and EPA Vapor Intrusion Screening Levels (VISLs) Target Groundwater Concentration at a target cancer risk of $1X10^{-6}$ and target hazard quotient of 1.

4.1 Soil Data Summary

VOCs A total of 14 soil samples (excluding duplicates) were analyzed for VOCs. Several VOCs were detected in very low concentrations that did not exceed a regulatory screening level. The concentration of bromodichloromethane (SE-SB-21 @ 7) and TCE (SE-SB-22 @ 7 and SE-SB-24 @ 7) exceeded the EPA Residential RSL. The concentration of TCE reported from SE-SB-21 @ 7 exceeded the EPA Industrial RSL.

No other VOCs were reported above an EPA RSL or other applicable screening level.

Metals A total of 14 soil samples (excluding duplicates) were analyzed for the 13 priority pollutant metals and hexavalent chromium. An additional four soil samples were analyzed for hexavalent chromium only.

Hexavalent chromium exceeded the EPA Residential RSL in four boring locations (SE-SB-16 @ 5, SE-SB-17 @ 2.5, SE-SB-19 @ 4 and 8, and SE-SB-23 @ 10). Depth of impacted soil ranged from 2.5 feet bgs to 10 feet bgs.

All soil samples detected arsenic concentrations above the EPA Residential RSL, with 13 out of 14 samples also exceeding the Industrial RSL. Lead exceeded the EPA Residential RSL in sample SE-SB-21 @ 7.

pH Soil pH ranged from 7.61 to 10.7.

4.2 Groundwater Data Summary

VOCs TCE was reported in six of the seven groundwater samples. The concentrations reported exceeded EPA RSLs, MCLs, or UGWQSs.

The concentration of TCE exceeded the EPA's Target Groundwater Residential VISL in five of the seven groundwater samples, with four of those samples exceeding the Target Groundwater Commercial VISL. Three of the groundwater samples exceeding the Target Groundwater Commercial VISL were collected inside the building.

Metals Six of the seven groundwater samples detected dissolved arsenic at a concentration above the EPA RSL for Tapwater. Five of the seven samples reported hexavalent chromium at a concentration exceeding the EPA RSL for Tapwater.

pH Field-measured pH was reported at 7 for all borings selected for groundwater sample collection.

4.3 Sub-slab Vapor Summary

VOCs Several VOCs were detected in very low concentrations that did not exceed a regulatory screening level. Napthalene was detected above the Target Sub-Slab Soil Gas Residential VISL in two vapor samples, with naphthalene exceeding the Target Sub-Slab Soil Gas Commercial VISL in one of those two samples. Trichloroethene was reported above the EPA Target Sub-Slab Soil Gas Residential VISL in all four samples, with three of those four samples exceeding the Target Sub-Slab Soil Gas Commercial VISL.

5.0 DATA QUALITY ASSESSMENT

All laboratory analytical data were subject to internal reduction and validation prior to external release of the data, as detailed in the laboratory's Quality Assurance Manual. Following receipt of the laboratory analytical results by Terracon, the data were reviewed to evaluate compliance with Data Quality Indicators (DQIs) outlined in Sections D1, D2, and D3 of the QAPP.

Documentation provided with the laboratory analytical results included a case narrative; analytical data with minimum detection limits and reporting limits listed for all analyses; surrogate recoveries for GC/MS analyses with laboratory control limits; chain-of-custody records; and a quality control summary, including method blanks, matrix spike/matrix spike duplicates (MS/MSD) with control limits, laboratory control samples and duplicates (LCS/LCSD) with control limits; and application of data qualifiers where warranted.

Assessment of the DQIs for Precision, Bias and Accuracy, Representativeness, Comparability, Completeness, and Sensitivity are presented in the following subsections.

5.1 Precision

Precision was evaluated on the basis of relative percent difference (RPD) as a measure of reproducibility between LCS/LCSD pairs and MS/MSD pairs (*analytical precision*) and between field samples and field duplicate samples (*field precision*).

Analytical Precision

A summary of the Quality Control assessment for *analytical precision* is presented in Table C10 (Appendix C) and is further discussed below.

- The RPDs for the LCS/LCSD pairs for lab set L995461 were within the laboratory's control limits, except for naphthalene and 1,2,3-trichlorobenzene for batch WG1114510 (groundwater sample analyses for VOCs by Method 8260B) and acetone for batch WG1114961 (soil sample analyses for VOCs by Method 8260B). Of the 378 constituents analyzed in the LCS/LCSD pairs, 375 (99.2%) were within the control limits for *Precision*. Each analytical batch was individually within the control limits. ***The LCS/LCSD pairs are considered within control for Precision.***

- The RPDs for the MS/MSD pairs for lab set L995461 were within the laboratory's control limits, except for hexavalent chromium for batches WG1114983 and WG1117105 (soil sample analyses for hexavalent chromium by Method 3060A/7196A), 2-chloroethyl vinyl ether for batch WG1114510 (groundwater sample analyses for VOCs by Method 8260B), and 37 of the VOCs for batch WG1116592 (soil sample analyses for VOCs by Method 8260B). Of the 241 constituents analyzed in the MS/MSD pairs, 201 (83.4%) were within the control limits for *Precision*. Four of the analytical batches were outside of the control limits (WG1114983, WG1117105, WG1114510, and WG1116592).

    - **Batch WG1114983:** Hexavalent chromium in these 14 soil samples was generally reported at concentrations above its residential RSL or had LRLs that exceeded its residential RSL. As the *Precision* could affect the conclusions regarding these results, ***hexavalent chromium analytical results in soil should be considered qualified***.

    - **Batch WG1117105:** Hexavalent chromium in soil sample SE-SB-24 (7) had a LRL that exceeded its residential RSL. As the *Precision* could affect the conclusions regarding these results, ***hexavalent chromium analytical results in soil should be considered qualified***.

    - **Batch WG1114510:** 2-chloroethyl vinyl ether was not reported above the LRL for the MS or MSD analyses. While the MS and MSD results were both non-detect, which is technically within control, neither analyses detected the spiked amount of this compound. The MS and MDS results were flagged with J6 (The sample matrix interfered with the ability to make any accurate determination; spike value is low.). 2-chloroethyl vinyl ether was not reported in any of the groundwater samples analyzed above the LRL. Because this constituent was not detected and because regulatory screening levels have not been

established for this constituent, the MS/MSD pair *Precision* is not anticipated to affect the usability of the data for comparison to regulatory screening levels. ***The Precision for the MS/MSD pair is considered acceptable.***

- **Batch WG1116592:** One sample was affected by this MS/MSD pair *Precision* deviation in batch WG1116592, soil sample SE-SB-18 (8). As the constituents analyzed for this sample were reported as less than the method reporting limits (two J-flagged constituents reported at concentrations less than the reporting limits), the MS/MSD pair *Precision* is not anticipated to affect the usability of the data for comparison to regulatory screening levels. ***The Precision for the MS/MSD pairs is considered acceptable.***

- The RPDs for the LCS/LCSD pairs for lab set L995391 were within the laboratory's control limits for all constituents analyzed (soil gas analyses for VOCs by Method TO-15). ***The LCS/LCSD pairs are considered within control for Precision.***

- An MS/MSD pair was not analyzed or reported for lab set L995391 because MS/MSD analyses are not included in the TO-15 analytical method procedures for *Precision*.

Field Precision
A summary of the Quality Control assessment for *field precision* is presented in Table C10 (Appendix C) and is further discussed below.

- Per the QAPP, analytical results for field duplicate pairs that are less than five times the laboratory's reporting limit (LRL) were considered within control if the difference between the sample and its duplicate was less than the LRL (aqueous samples) or two times the LRL (solid samples). When analytical results for field duplicate pairs are greater than five times the LRL, the duplicate pair was considered within control when the RPDs for the field duplicate pairs were within the QAPP's control limits (25% for aqueous samples and 50% for solid samples). The field duplicate pair constituent analytical results were within control for lab set L995461, except for the following.

Field Duplicate Pair Analyses	**Constituents outside of *Precision* control limits**
VOCs in soil by Method 8260B for field duplicate pair SE-SB-24 (7) and SE-SB-34 (7):	benzene, 1,2-dichloropropane, ethylbenzene, isopropylbenzene, naphthalene, toluene, trichloroethene, 1,2,4-trimethylbenzene, 1,2,3-trimethylbenzene, 1,3,5-trimethylbenzene, and total xylenes
Metals in soil by 6000/7000 Series Methods for field duplicate pair SE-SB-24 (7) and SE-SB-34 (7):	mercury (Method 7471A)

VOCs in groundwater by Method 8260B for field duplicate pair SE-SB-22 and SE-SB-32:	trichloroethene
Dissolved metals in groundwater by 6000/7000 Series Methods for field duplicate pair SE-SB-22 and SE-SB-32:	all constituents analyzed within the control limits

Of the 161 constituents analyzed in the field duplicate pairs, 148 (91.9%) were within the control limits for *Precision*. Each analysis was individually within the control limits, except for VOCs by Method 8260B for L995461-08 (sample) and L995461-28 (duplicate sample), which had 83% of the constituents in control. In general, the constituents that were outside of the control limits for *Precision* were reported at concentrations well below their regulatory screening levels. Two constituents, 1,2-dichloropropane and trichloroethene reported concentrations closer to their regulatory screening levels. For these two constituents, the *Precision* could affect the conclusions drawn with regards to the regulatory screening levels. As such, 1,2-dichloropropane and trichloroethene results should be considered qualified. Matrix interference was likely the primary cause of the lower percentage of valid data for this analysis in soils. ***The Precision for the field duplicate pairs is considered acceptable, except for 1,2-dichloropropane and trichloroethene in soils, which are considered to have qualified analytical results.***

5.2 Bias and Accuracy

Bias and ***Accuracy*** were evaluated through a review of the method blanks, trip blanks, percent recoveries for LCS/LCSD, and percent recoveries for MS/MSD summaries provided by the laboratory. Method blanks and trip blanks were considered within control if the constituents analyzed were less than the analytical method reporting limits. LCS/LCSD and MS/MSD analyses were considered within control if the percent recoveries were within the laboratories established limits. A summary of the Quality Control assessment for *Bias* and *Accuracy* is presented in Table C10 (Appendix C) and is further discussed below.

Lab Set L995461

- **Trip Blank:** The trip blank reported four constituents (acetone, cis-1,2-dichloroethene, toluene, and total xylenes), but the concentrations were less than the LRLs (i.e., J-flagged results). ***The Trip Blank is considered in control for Bias and Accuracy.***

- **Method Blank:** Constituents reported in the Method Blanks included tetrachloroethene and 1,2,3-trichlorobenzene in batch WG1114510, hexachloro-1,3-butadiene and 1,2,3-trichlorobenzene in batch WG1114542, and methylene chloride in batch WG1115967. The reported concentrations were less than the LRLs. ***The Method Blank is considered in control for Bias and Accuracy.***

- **LCS/LCSD:** The percent recoveries for constituents analyzed in the LCS and LCSD samples were within the laboratory's control limits, except for the following:

  - **Batch WG1115415:** acrolein (LCS), 1,2-dibromo-3-chloropropane (LCS and LCSD), and naphthalene (LCSD).
  - **Batch WG1114961:** 4-chlorotoluene (LCS).
  - **Batch WG1115967:** acetone (LCSD).
  - **Batch WG1116592:** 1,2-dichloroethene (LCS).

  Of the 886 constituents analyzed in the LCS and LCSD samples, 879 (99.2%) were within the control limits for *Bias* and *Accuracy*. Each analytical batch was individually within the control limits. ***The LCS/LCSD pairs are considered within control for Bias and Accuracy.***

- **MS/MSD:** The percent recoveries for constituents analyzed in the MS and MSD samples were within the laboratory's control limits, except for the following:

  - **Batch WG1114983 (soil):** hexavalent chromium (MS and MSD).
  - **Batch WG1117105 (soil):** hexavalent chromium (MS and MSD).
  - **Batch WG1113326 (groundwater):** hexavalent chromium-low level (MS).
  - **Batch WG1115713 (groundwater):** hexavalent chromium-low level (MS and MSD).
  - **Batch WG1114824 (soil):** antimony (MS and MSD) and zinc (MS and MSD).
  - **Batch WG1115667 (soil):** antimony (MS and MSD).
  - **Batch WG1114510 (groundwater):** 2-chloroethyl vinyl ether (MS and MSD).
  - **Batch WG1115967 (soil):** carbon tetrachloride (MS) and dichlorodifluoromethane (MS and MSD).
  - **Batch WG1116592 (soil):** p-isopropyltoluene (MS).

  Of the 482 constituents analyzed in the MS and MSD samples, 465 (96.5%) were within the control limits for *Bias* and *Accuracy*. For analytical batches WG1114983, WG1117105, WG1113326, WG1115713, and WG1114824, less than 90% of the data passed the QC criteria.

  - Hexavalent chromium was generally reported in soil at concentrations above its residential RSL or had LRLs that exceeded its residential RSL. As the *Bias* and *Accuracy* control could affect the conclusions regarding these results, ***hexavalent chromium analytical results in soil should be considered qualified***.

  - Hexavalent chromium-low level was generally reported in groundwater at concentrations above the tapwater RSL. As the *Bias* and *Accuracy* control could affect the conclusions regarding these results, ***hexavalent chromium-***

low level analytical results in groundwater should be considered qualified.

- Antimony and zinc concentrations reported in soil were orders of magnitude less than the residential RSLs. ***Bias and Accuracy control are unlikely to affect the conclusions regarding these results and they can be used for their intended purpose of comparison to the screening levels.***

- Regulatory screening levels have not been established for 2-chloroethyl vinyl ether or p-isopropyltoluene. As such, the ***Bias and Accuracy control is not anticipated to affect the conclusions of this report.***

- Carbon tetrachloride and dichlorodifluoromethane were not reported in soil above their LRLs, which were orders of magnitude less than the residential RSLs. ***Bias and Accuracy control are unlikely to affect the conclusions regarding these results and they can be used for their intended purpose of comparison to the screening levels.***

5.3 Representativeness

Representativeness is a qualitative parameter most concerned with proper design and execution of the sampling program to produce data that accurately and precisely represent environmental conditions. Selection of analytical methods, sampling methods and locations representative of the media sampled were set forth in the SAP. *Representativeness* in the field was achieved by implementing the approved SAP and using appropriate sampling methods, sample containers, sample handling and preservation methods. *Representativeness* in the laboratory was achieved by using the proper analytical procedures, meeting sample holding times, and analyzing and assessing laboratory QA/QC samples. Sample holding time requirements were achieved with the exception of pH. ***Per the DQIs in the QAPP, the Representativeness criteria have been met as the SOPs were followed, holding times were met (except for pH as mentioned above), and blanks reported constituents were less than the LRLs.***

5.4 Comparability

Comparability is a qualitative term expressing the confidence with which one data set can be compared to another. The comparability goal was achieved through the use of standardized sampling procedures in accordance with the SAP and QAPP, use of standardized and approved laboratory analytical methods, and reporting the analytical results in appropriate and consistent units.

- One trip blank (water matrix) was submitted with the 8 groundwater samples collected, which represents a frequency of 12.5% and exceeds the QAPP goal of 10%.

- One field duplicate (water matrix) was submitted with the 8 groundwater samples collected, which represents a frequency of 12.5% and exceeds the QAPP goal of 10%.

- Two field duplicates (soil matrix) were submitted with the 22 soil samples collected, which represents a frequency of 9.1%, below the QAPP goal of 10%. However, the number of field duplicates meets the two field duplicates that were specified in the approved SAP.

- The units of measure reported by the laboratory were consistent with the units of measure used by the regulatory screening levels.

- Samples were collected following the SOPs.

With the exception of the frequency of field duplicate samples for the soil matrix, which was slightly below its DQI but equal to the number specified in the SAP, the DQIs for *Comparability* were achieved. It is not anticipated that another field duplicate pair would alter the conclusions of this report. As such, ***Comparability was deemed acceptable.***

5.5 Completeness

Completeness is the ratio of valid measurements to the number of planned measurements, expressed as a percentage, and the completeness goal for the project is 90%. The sampling program is deemed to meet the DQIs for valid measurements, with the following exceptions.

- Results of hexavalent chromium in soil are considered qualified due to *Analytical Precision and Bias/Accuracy* not being within the control limits.

- Results of hexavalent chromium in groundwater are considered qualified due to *Bias/Accuracy* not being within the control limits.

- Results of 1,2-dichloropropane and trichloroethene in soil are considered qualified due to *Field Precision* not being within the control limits.

Sample matrix interference and heterogeneity are considered to be the principal reasons that some of the QC samples did not meet DQIs. ***With the exception of the analytes listed above, the analytical data are acceptable for their intended use in identifying constituent concentrations above applicable screening levels.***

Based on the very limited number of qualified analytical results, the overall ratio of valid measurements to measurements collected exceeds the 90% goal established in the QAPP.

5.6 Sensitivity

Sensitivity refers to the capability of a method or instrument to discriminate between measurement responses representing different levels of the variable of interest. The sensitivity goal is for LRLs to be below comparative screening levels, which vary considerably by analyte and in value and applicability. For analytes in soil samples, the LRLs were below available screening levels with the following exceptions: the LRL exceeded the EPA Residential RSL for hexavalent chromium, thallium, and 1,2-dibromo-3-chloropropane. Overall, the level of sensitivity was sufficient to allow the identification of soil constituents above Residential and Industrial RSLs, and groundwater impacts above MCLs, UGWPSs, Target Groundwater VISLs and Target Sub-Slab Soil Gas VISLs.

6.0 DATA EVALUATION

Following is an overview of the identified contaminants in soil, groundwater, and sub-slab soil vapor during the course of the current Phase II ESA.

6.1 Soil Sample Results

The presence of hexavalent chromium in soils both outside and underneath the building was confirmed at depths ranging from 1 to 10 feet bgs. The concentrations reported in this investigation exceeded the Residential RSL but did not exceed the Industrial RSL.

TCE was also identified in soils at 7 feet bgs at concentrations that exceeded the Residential and Industrial RSLs. The concentration of lead at 7 feet bgs exceeded the Residential RSL at one sample location (SE-SB-21).

Naphthalene was detected in soil at two locations within the Plating Room at a depth of 7 feet. The detections were below State of Utah and EPA screening levels.

As reported in the 2015 investigation and identified during this investigation, arsenic concentrations in soil samples collected throughout the site are higher than the industrial RSL of 3 mg/kg. However, such exceedances are common throughout the Salt Lake Valley area where background values reportedly range from non-detect to 97 mg/kg (U.S. Geological Survey Professional Paper 1270; 1984). The arsenic concentrations reported in site soil samples ranged from 4.62 to 17.5 mg/kg in the 2015 investigation, and from 1.6 to 52.9 mg/kg in the 2018 investigation. Based on these results, the reported arsenic concentrations in soil appear to be representative of natural background levels.

6.2 Groundwater Sample Results

Based on the results of this additional investigation, the presence of TCE in groundwater was confirmed at concentrations that exceed the MCL and Target Groundwater Commercial VISL.

The presence of dissolved hexavalent chromium in groundwater was confirmed at concentrations that exceeded the RSL for Tapwater but below the MCL for total chromium.

6.3 Sub-slab Vapor Sample Results

The results of the sub-slab soil gas samples collected from the interior of the building reported naphthalene and TCE were present at concentrations that exceeded the Target Sub-Slab Soil Gas Commercial VISL. TCE was detected in all four of the soil gas samples with three (VP-1, VP-3 and VP-4) exceeding the Commercial VISL and VP-2 exceeding the Residential VISL The highest concentrations were in the Plating Shop (VP-4) and along the sewer lateral (VP-3). Naphthalene was detected in sub-slab soil gas above the Commercial VISL along the sewer lateral (VP-3) and above the Residential VISL in the Washout Booth (VP-2). Based on the sub-slab soil gas sampling results, It appears there is a potential for vapor intrusion at this site.

7.0 CONCLUSIONS AND RECOMMENDATIONS

7.1 Conclusions

Impacts to soil and groundwater exceeding EPA RSLs for both Residential and Industrial land use have been identified at the site.

Soil impacts include bromodichloromethane and lead above the Residential RSL at 7 feet bgs, and TCE above the Residential and Industrial RSL at 7 feet bgs. Concentrations of hexavalent chromium exceeded the Industrial RSL in shallow soils and the Residential RSL at depths up to a minimum of 10 feet bgs.

Dissolved hexavalent chromium and arsenic were reported above the RSL for Tapwater in groundwater, but below the MCL. TCE was reported to exceed the EPA MCL and UGWQS, as well as the Target Groundwater Commercial VISL.

Both naphthalene and TCE were detected in sub-slab soil gas samples. Concentrations of TCE exceeded the Target Sub-Slab Target Soil Gas Commercial VISL in three locations within the building and the fourth exceeded the Residential VISL. The concentrations of naphthalene exceeded the Sub-Slab Target Soil Gas VISL in two of the samples. One exceeded the Commercial VISL and one exceeded the Residential VISL. The highest concentrations were from sample VP-3 located adjacent to a sewer lateral and collection point. The sewer lateral originates from a sump in the floor of the Plating Room. Use of small amounts of TCE (5 gallons or less) by

Schovaers has been documented. The origin of the naphthalene identified in two sub-slab soil gas samples is unknown but may be related to the undocumented subsurface fill throughout much of the site. Further investigation of naphthalene does not appear warranted at this time, as this compound has not been identified in groundwater and only two minor detections have been identified in soils. Addressing the sub-slab TCE soil gas will also address naphthalene in soil gas.

7.2 Extent of Impacts

TCE was not reported in soil samples collected outside the building during the 2016 investigation from depths ranging between 9.5 to 14.5 feet bgs. TCE was reported in soil samples collected during this investigation inside the building from depths ranging between 3 to 10 feet bgs. The highest concentration of TCE reported in soil (45.2 mg/kg) and groundwater (0.0766 mg/L) was observed in boring SE-SB-21, adjacent to the sump located inside the building. Based on results from the 2016 investigation and this investigation, dissolved TCE concentrations in groundwater above the drinking water MCL are present beneath the western portion of the building and the western portion of the property outside the building footprint. As dissolved TCE was not reported along the up-gradient east-northeast property boundary in previous borings SE-SB-09, -12, -13, -14, -15, and the highest concentrations of TCE were observed inside the building, it appears that the subject property may be a likely source of TCE.

Hexavalent chromium was reported in soils inside the building at concentrations exceeding the Residential RSLs, and outside the building exceeding both the Residential and Industrial RSLs, at various depths. The highest concentrations of hexavalent chromium observed in soils, exceeding the Industrial RSLs, were reported from the southwest side of the property. Hexavalent chromium was also present in soils on the south side of the property. The highest concentrations of dissolved hexavalent chromium were also reported on the west side of the property.

Schovaers did not report the use of hexavalent chromium at the facility. Hexavalent chromium was reported in soils and in groundwater at the north-adjoining Crown Plating facility; however, the highest concentrations reported in soils and groundwater at the Schovaers property were not reported on the north side of the property. The concentrations of hexavalent chromium reported in soils and groundwater, and the calculated groundwater flow direction for both the Crown Plating facility and Schovaers, do not definitively support Crown Plating as the source. The source of hexavalent chromium on the Schovaers property is unknown.

7.3 Recommendations

The 2015 Asbestos and Hazardous Materials Survey identified friable and non-friable asbestos-containing material and also identified several universal hazardous waste materials that would need to be properly disposed or recycled prior to demolition.

Soils impacted above applicable screening levels may need to be removed and properly disposed during construction or managed as part of future redevelopment. Impacted groundwater may need to be managed during construction, and may need to be addressed through monitored natural attenuation or active remediation. Future development would need to address impacts in a manner that is consistent with the planned land use in the area. As the concentrations of TCE in groundwater and sub-slab soil gas exceeded both Residential and Industrial Target VISLs, the potential for vapor intrusion should be evaluated and mitigated.

Planning for future redevelopment in the area must take into consideration the results of the investigations conducted at the site. In evaluating Brownfields re-use of the property, it may be appropriate to consider redevelopment-specific land use and contaminant exposures, including vapor intrusion mitigation. Evaluation might consider land use-specific and contaminant-specific risk assessments.

16.0	***Probe Terminated at 16 Feet***					0	

The stratification lines represent the approximate transition between differing soil types and/or rock types; in-situ these transitions may be gradual or may occur at different depths than shown.

Advancement Method:
Direct Push

Abandonment Method:
Boring backfilled with bentonite
Surface capped with concrete

See Appendices for description of field procedures.
See Appendices for description of laboratory procedures and additional data (if any).
See Appendices for explanation of symbols and abbreviations.

Qualifiers - J: The identification of the analyte is acceptable; the reported value is an estimate. J3: The associated batch QC was outside the established quality control range for precision. J4: The associated batch QC was outside the established quality control range for accuracy.
* - 1,2-dichloropropane or trichloroethylene was reported at a concentration close to its regulatory screening levels in this sample. As these constituents were outside of their control limits for Precision in the field duplicate pair, their analytical results are considered qualified and may not be acceptable for comparison to the screening levels.
1 - Environmental Protection Agency Regional Screening Levels for Residential soil (May 2018; Target Hazard Quotient=1).
2 - Environmental Protection Agency Regional Screening Levels for Industrial soils (May 2018; Target Hazard Quotient=1).
3 - Utah Department of Environmental Quality Initial Screening Level for petroleum hydrocarbons in soil. bromodi
Shaded value reported above laboratory reporting limit. *Italized values* exceed Screening Level.
ne - not established. mg/kg - milligrams per kilogram.

Table C2 - Metals in Soil
Schovaers Electronics Property - 22 South Jeremy Street, Salt Lake City, Utah

Qualifiers: J: The identification of the analyte is acceptable; the reported value is an estimate. J3: The associated batch QC was outside the established quality control range for precision. J6: The sample matrix interfered with the ability to make any accurate determination; spike value is low. O1: The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference. P1: RPD value not applicable for sample concentrations less than 5 times the reporting limit. T8: Sample(s) received past/too close to holding time expiration.
1 - Environmental Protection Agency Regional Screening Levels for Residential soil (June 2018; Target Hazard Quotient=1).
2 - Environmental Protection Agency Regional Screening Levels for Industrial soils (June 2018; Target Hazard Quotient=1).
Shaded value reported above laboratory reporting limit. *Italized values* indicate reporting limit above Screening Level.
ne - not established. mg/kg - milligrams per kilogram. su - standard unit.

Table C3 - VOCs in Groundwater
Schovaers Electronics Property - 22 South Jeremy Street, Salt Lake City, Utah

Qualifiers - E: The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
1 - Environmental Protection Agency Residential Vapor Instrusion Screening Level (May 2018; Target Hazard Quotient=1).
2 - Environmental Protection Agency Industrial Vapor Instrusion Screening Level (May 2018; Target Hazard Quotient=1).
Shaded value exceeds laboratory reporting limit.
ug/m3 - micrograms per meter cubed. ne - not established

1 - Qualifiers:
J: The identification of the analyte is acceptable; the reported value is an estimate.
J3: The associated batch QC was outside the established quality control range for precision.
J4: The associated batch QC was outside the established quality control range for accuracy.
*: 1,2-dichloropropane and trichloroethylene were reported at concentrations close to their regulatory screening levels. As these constituents were outside of their control limits for *Precision* , their analytical results are considered qualified and may not be acceptable for comparison to the screening levels.

2 - RDL - Laboratory reported detection limit

3 - RPD - Relative Percent Difference was calculated when analyte concentrations are greater than or equal to five times the RDL.
QA/QC Goal is less than 50% for solid samples. RPDs greater than 50% are bold and highlighted in orange.

4 - For analytes reported at concentrations less than five times the RDL, the QA/QC Goal is less than two times the RDL for solid samples.
Half the RDL was used for analytes reported less than the RDL. Pairs that exceed two times the RDL are bold and highlighted in orange.

1 - Qualifiers:
J: The identification of the analyte is acceptable; the reported value is an estimate.
J3: The associated batch QC was outside the established quality control range for precision.
J6: The sample matrix interfered with the ability to make any accurate determination; spike value is low.
O1: The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.
P1: RPD value not applicable for sample concentrations less than 5 times the reporting limit.
2 - RDL - Laboratory reported detection limit
3 - RPD - Relative Percent Difference was calculated when analyte concentrations are greater than or equal to five times the RDL. QA/QC Goal is less than 50% for solid samples. RPDs greater than 50% are bold and highlighted in orange.

1 - Qualifiers:
J3: The associated batch QC was outside the established quality control range for precision.
J4: The associated batch QC was outside the established quality control range for accuracy.
2 - RDL - Laboratory reported detection limit
3 - RPD - Relative Percent Difference was calculated when analyte concentrations are greater than or equal to five times the RDL.
QA/QC Goal is less than 25% for aqueous samples. RPDs greater than 25% are bold and highlighted in orange.
4 - For analytes reported at concentrations less than five times the RDL, the QA/QC Goal is less than the RDL for aqueous samples.
Half the RDL was used for analytes reported less than the RDL. Pairs that exceed two times the RDL are bold and highlighted in orange.

1 - Qualifiers:
J: The identification of the analyte is acceptable; the reported value is an estimate.
J5: The sample matrix interfered with the ability to make any accurate determination; spike value is high.
2 - RDL - Laboratory reported detection limit
3 - RPD - Relative Percent Difference was calculated when analyte concentrations are greater than or equal to five times the RDL. QA/QC Goal is less than 25% for aqueous samples. RPDs greater than 25% are bold and highlighted in orange.
4 - For analytes reported at concentrations less than five times the RDL, the QA/QC Goal is less than the RDL for aqueous samples. Half the RDL was used for analytes reported less than the RDL. Pairs that exceed two times the RDL are bold and highlighted in orange.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Sample Handling and Receiving

The following analysis were performed from an unpreserved, insufficiently or inadequately preserved sample.

ESC Sample ID	Project Sample ID	Method
L995461-03	SE-SB-21	7199
L995461-20	SE-SB-18	7199
L995461-27	SE-SB-32	7199

The analysis for 2-Chloroethyl Vinyl Ether was conducted from a chemically preserved container.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J1	Surrogate recovery limits have been exceeded; values are outside upper control limits.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.
O1	The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.
P1	RPD value not applicable for sample concentrations less than 5 times the reporting limit.
T8	Sample(s) received past/too close to holding time expiration.

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by ESC Lab Sciences.

Our Locations

ESC Lab Sciences has sixty-four client support centers that provide sample pickup and/or the delivery of sampling supplies. If you would like assistance from one of our support offices, please contact our main office. ESC Lab Sciences performs all testing at our central laboratory.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by ESC Lab Sciences.
